Adrian. I've seen you post this request a few times. If you can't figure it out by trouble-shooting, I think you are just gonna have to break down and buy the service manual.

My personal fav is the DZ 302 as fitted to the 67-69 Camaro (Z/28 only). This is a solid lifter engine with 11:1 compression out of the box. They used a chamber-style exhaust. The sound of this engine is very unique. It will run an easy 14. Probably faster if fitted with the factory traction bars and cross-ram intake (mine not so equipped) or speed-shifted. The '60s Z/28s were built for speed and could not be ordered with automatic trannys or air conditioning - quite unlike what I call the disco and heavy-metal era models of the '70s & '80s which were merely cosmetically made-over sport coupes.

First, I would inspect the guitar input socket for wear. Is the plug "crunchy"
when
you wiggle the guitar plug in it?

Actually, it is slightly sharper filtering and a slightly different
de-emphasis curve. (The pre-emph on the Tx is slightly different too, if
done properly). Every FM CB I've seen is phase modulated anyway.

> Given the current state of CB radio where AM transmitters are modified
> to the extreme, can you imagine the temptation to "peak" the deviation
> on an FM rig?  We're talking wide-band here!

That's the beauty of FM. The wider the deviation, the less distance your
signal travels. Also, the squelch circuit of the person/people you are
talking to will tend to mute an over-deviated transmitter.

> While I fully agree that FM has advantages, such as better audio,

Anyone in the San Diego area:

I was over by the Old Town rail station recently and kept hearing a loud
beeping noise that repeated itself at 10 second intervals.  Anyone know
what this is?  It's only when I'm over by there - was wondering if it
might be from something going on over at the Lockheed Martin facility
next door to the station.

I don't know how all you guys with the "Big Stuff" get away with it. You must all live in the Swamp or 50,000 miles from nowhere. I used to run a 1kw box here at the house in central PA in a populated area, with a Moonraker 4 at 60 ft. with a clean radio and the amp was clean. Never ran till after midnite or selectively during the day, and I still had people beating on the door. One instance in particular someone I knew was eating in a resturant with music coming across the PA system and they heard me shootin' skip over the music TWO MILES down the road. After that report I shut her down.

900 dollars?? your NUTS.. that rig doesnt have the auto ant tuner its not
worth 900 bucks.. the mod thats very easy. it takes more time to take it
apart and put it together.
That rig goes for with ant tuner about 800.....wish you luck maybe some
sucker will buy it.. and the AM sucks the big one on the rig

*
*> What the hell is the difference?  Is it just repeater dial up capability or
*> what?
*
*The biggest difference is the 2600 can't be modified for eleven meters
*(CB band) unless you change the PLL. It does not have a roger beep,
*does not have P.A. It does have a repeater offset switch and a switch
*to turn the RIT off and on. The 2600 also has fewer wires under the
*hood. There are also some small refinements in the overall design.
*
*I have put a Chipswitch in my 2600 and it covers 24.8-30 MHz. It also
*adds a bunch of other stuff like memories. I unlocked my Chipswitch
*with a password and it will dial down to 20.9 MHz, but the VCO will
*let go around 23.5 MHz. I tried playing with the VCO to broadband it,
*but I just don't have the time anymore. If there is anyone else who has
*fixed their VCO to lock in the 15 meter band, I would like to talk with
*you about it.
*
*Harry
*****************************

There is little or not design improvements to the 2600 over the 2510. In
addition to the differences that you mentioned, the micro-computer used has
defferent firmware in it. That firmware can due some interesting things on it's
own. Though you must have the original chip in the PLL.

For CB radios and CB radios marketed as a 10M radio they are all about the same. Not much difference between them. That even includes the Unidens designed quote/unquote for the 10M band. IF they use a bipolar transistor inthe RF amp and/or first mixer then they all have basically the same performance.

*SSB receivers are superior to dual or triple. Once again, more isn't
*necessarily better.
*
*MC
******************************

The biggest problem with multi-conversion receivers are the design of the mixer stages. In order to get good dynamic range the mixers need to be doubly balanced to start. But with good design the performance of a dual or triple conversion receiver can equal that of a single conversion. Now the single conversion will cost less though.

Boredom has finally set in. I have decided to make a change to my mobile. I would like to put my proven Grant XL on stand-by (not 10-7). I'm looking for a new radio to play with. Since it is possible to make almost any radio talk, I need one that has good ears. The 2510 seems to be the front runner. The problem is they are no longer in production. Are there any new radios on the market with comparable RX performance?

The finals get about 3.8v to them factory. Applying 13.8v directly to the final of that radio would be the equivalent of charging your car battery at about 40v. Not a wise idea. Maybe about 6v.

Thanks - Are you originally from the San Diego area?  I'm new here - and
am gradually realizing that the terrain is not always conducive to
mobile reception.  I get pretty good reception inland, but when I go
West and I pass behind the ridge on Point Loma, it's like a blackout
except for a few chatters in OB, MB, and PB.

I have recently come into possession of an HR2510, unfortunately I do
not have the users manual for it.  I anyone could please post a link to
an online site for the manual or a manual in a file format I would
greatly appreciate it.

narrower bandwith, more range. FM is known for it's great sound quality, not it's range. SSB is known for it's range, but it has "average" sound quality at best compared to Fm.

And, AM is just right. QSL?

Texas are still my favorite "out of the box" amp by a wide margin. For the average user, they are an excellent design and provide day in and day out service. Sure, there is room for improvements, but they work FAR better, more reliably and more consistently than any other "mass produced" piece that i have ever seen. I just wish that their "high drives" were real high drives. Sean
>

Sean wrote in message ...
Adding bias reduces switching distortion, making the amp much cleaner to begin with. The majority of "no bias" amps typically run into problems in this area due to the different levels of "gating" involved and their various gain curves. The more pills involved, the bigger the variance and the problems. With no bias amps, one transistor might be fully on while the other is on the edge. Talk about an imbalance in output !!!

As to the Blue Faces, they are the same ones. I have had MAJOR problems with the 450's and don't recommend them at all. All of those amps use little "weasely" relays that don't hold up well. This is not to mention the complete lack of quality control. I have had brand new amps come in that had parts that were not soldered in, pills that were not properly seated, etc....

If you want to see these amps get REAL squirrely, put a metal lid on them instead of the plastic lid. There's a reason that Otis went to the plastic and it wasn't strictly a matter of economics either. I know that Dennis has experienced the same problems that i have ( not that this means i am right and your wrong ).

I used to like the blue faces before they were known as blue faces. That basic design has been around for a long time. Sean
>

Bill Eitner wrote in message <38570B44.30BF4371@netzero.net>...
Sean wrote:

> Your observation about amps with bias going into oscillation is right on.
> The bias adds stability to the amp.

I find just the opposite. Bias increases the small signal gain. That increases the amplitude of the harmonic and parasitic content.

> If it still oscillates, it is a REAL
> piece of junk or severely out of tune.

In my experience, reducing the bias reduces the level of "garbage" in the output signal when an amp is somewhat unstable. In other words, other factors are the cause of the instability, and adding bias just makes it that much worse.

> The little "blue faces" tend to do
> this and have come WAY down in quality over the years.

I've never seen a Blue Face go into oscillation even when the output SWR is way off. There's a big difference between instability and oscillation. An amp that is oscillating actually runs by itself. An unstable amp has unusually high harmonic and parasitic levels but will not run without an input signal. Oscillation is instability taken to an extreme.

The 200, 250, and 350 XL series Blue Face amps are overbiased when in the "max" position because the bias rides in with the input signal and is reduced right along with the input signal in the lower output positions. This causes a higher level of instability than would ordinarily be seen with lower bias. The solution is simple: either use a lower output setting (avoid the "max" setting) or reduce the bias by clipping a leg of (or removing) one of the bias resistors. The 225s are not over-biased in their highest output position, and the

450s use a very well done, fully regulated and adjustable bias circuit where the bias is separate from the input signal. The 450s can be made more rugged by reducing the bias. It's a simple procedure to change them from AB to very close to B class. There are two bias adjustment pots with arrow-shaped screwdriver slots in them. When stock, the arrows point toward the rear of the amp. Simply turn the left-hand pot to its fully clockwise position, and the right-hand pot to its fully counter-clockwise position.

As for the quality of the Blue Face amps, it hasn't changed in the time that I've been dealing with them. The Blue Face amps still have the best build quality I've ever seen in a production (mass-produced) CB amp.

To Sean: If you have access to a digital camera, we should exchange pictures of the Blue Face amps that we've dealt with. It seems like you've always been down on them, and I've always viewed them as one of the best. It's like we're dealing with two separate amp lines but calling them by the same name.

Adding bias reduces switching distortion, making the amp much cleaner to begin with. The majority of "no bias" amps typically run into problems in this area due to the different levels of "gating" involved and their various gain curves. The more pills involved, the bigger the variance and the problems. With no bias amps, one transistor might be fully on while the other is on the edge. Talk about an imbalance in output !!!

As to the Blue Faces, they are the same ones. I have had MAJOR problems with the 450's and don't recommend them at all. All of those amps use little "weasely" relays that don't hold up well. This is not to mention the complete lack of quality control. I have had brand new amps come in that had parts that were not soldered in, pills that were not properly seated, etc....

If you want to see these amps get REAL squirrely, put a metal lid on them instead of the plastic lid. There's a reason that Otis went to the plastic and it wasn't strictly a matter of economics either. I know that Dennis has experienced the same problems that i have ( not that this means i am right and your wrong ).

I used to like the blue faces before they were known as blue faces. That basic design has been around for a long time. Sean

Sean wrote:

> Your observation about amps with bias going into oscillation is right on.
> The bias adds stability to the amp.

I find just the opposite. Bias increases the small signal gain. That increases the amplitude of the harmonic and parasitic content.

> If it still oscillates, it is a REAL
> piece of junk or severely out of tune.

In my experience, reducing the bias reduces the level of "garbage" in the output signal when an amp is somewhat unstable. In other words, other factors are the cause of the instability, and adding bias just makes it that much worse.

> The little "blue faces" tend to do
> this and have come WAY down in quality over the years.

I've never seen a Blue Face go into oscillation even when the output SWR is way off. There's a big difference between instability and oscillation. An amp that is oscillating actually runs by itself. An unstable amp has unusually high harmonic and parasitic levels but will not run without an input signal. Oscillation is instability taken to an extreme.

The 200, 250, and 350 XL series Blue Face amps are overbiased when in the "max" position because the bias rides in with the input signal and is reduced right along with the input signal in the lower output positions. This causes a higher level of instability than would ordinarily be seen with lower bias. The solution is simple: either use a lower output setting (avoid the "max" setting) or reduce the bias by clipping a leg of (or removing) one of the bias resistors. The 225s are not overbiased in their highest output position, and the 450s use a very well done, fully regulated and adjustable bias circuit where the bias is separate from the input signal. The 450s can be made more rugged by reducing the bias. It's a simple procedure to change them from AB to very close to B class. There are two bias adjustment pots with arrow-shaped screwdriver slots in them. When stock, the arrows point toward the rear of the amp. Simply turn the left-hand pot to its fully clockwise position, and the right-hand pot to its fully counter-clockwise position.

The JB 2000 was the one that had the driver tube in it.  The model that used
only the two 3-500's was the JB-1080 and had a band select switch on it.

You would be REALLY surprised at what a clean Black Cat two tuber will sell
for.  WAY more than what you think.  At $350 with fresh tubes, i would take
ALL of them that i could find.  Sean

> ..............

There was another JB2000 that used a pair of 3-500's and had a
small driver stage tube also. I forget the driver tube number but it
allowed a low power rig to drive the amp to hi output.
The transformers in these were pretty light duty so don't leave
it keyed at full output very long.
I'm afraid I've been out of the CB stuff too long to be able to
give you a recent price on one of these.
BobC.

Thanks for the excellent step by step.  My word wrap was set for 76, so
what's the deal ???  Sean
>

Hank Aaron wrote in message <834sti$o8v$1@nntp5.atl.mindspring.net>...
It appears you are using Outlook Express....  Do this from Outlook Express:

Tools
   |
   |
Options
   |
   |
"Send" Tab
   |
   |
"Settings" beside "Plain Text" under "News sending format"
   |
   |
"Automatically wrap text at  ###"  Try to set it from 70-76

Thats about it... that is IF you are using Outlook Express v.4.72.31 +

Take care.

Hank

Sean wrote in message ...

Toll Free wrote in message ...
If you only want to volt the final, then you cut the DC collector modulated feed (this is what supplies DC to it on SSB also) and put a choke in line and run a seperate lead out the back for the higher volts.

That is the easiest.

Now, if you want the best, I would run a regulator in the radio (3A would be fine) after the hash choke and use that to supply the rest of the radio, and use the higher voltage produced to run the final.

Toll Free

I was bored one day and started playing around with an old scanner I have.  I noticed that I could pick up cordless phones without interference at a distance of a couple blocks with the rubber duck antenna.  Hooking the A-99 60 ft up in the tree in my back yard to it increased the distance to a couple miles.  The problem was that it was hard to listen to an individual call for very long because if a stronger signal came in on the same channel, it got wiped out.  The same afternoon, I happened to hear my neighbor's wife on their cordless phone.  It had been speculated by us and the neighbors on the other side of the house that she had been cheating on her husband with a guy that lived a block down the street.  I just happened to pick up her call to her best friend, confessing the whole thing in very graphical detail.  The very next call that came through after she hung up was the wife of the guy she was screwing around with calling her Mother and telling her that she had found out about it and had kicked the guy out of the house.  Very interesting to say the least.  My wife and I had to act like we knew nothing about the entire situation whenever the subject was brought up by one of the neighbors...

I've had several 99's and the Imax, and I like the Imax 2000 much better on performance, plus I give no TVI. Be wary of generic antron 99's, however, calling themselves the "A99", instead of "antron 99" you can tell the difference by the the much cheaper price of the "A99", and believe me, you get what you pay for. But i still say the Imax 2000 is the best.

Sean,

I'll put Matt out of his misery.

He's possibly seen one on US tarmac but didn't realise what he was looking at.
>What's a Pantera ????  Trust me, "my son".  You have a lot to learn !!!!
>Sean

> Whats
>a pantera? Is that a overseas car?
An American Italian hybrid.

Designed by a Mr De Tomaso, an Argentinean based in Italy, bodies built by Ghia engines supplied by Ford, your very own 351C.

This was mated to a 5-speed ZF transaxle as the engine was mid mounted and drove the rear wheels.

It is an awesome sounding motor and AFAIK is/was holder of the title for the 'loudest' production car. The road shakes beneath it.

Most went to the US and were fitted with those awful 5mph bumpers unlike the Euro versions.

If you want to see some pictures there's plenty on the net. Just search
on 'pantera'.

Built my first diode detection at age 9.

A germanium diode across the two pins on the rear of a telephone
handsets earpiece and the outer shield of the TV antenna's feeder
connected to one of the pins.

No tuning of course.

This was before the UK woke up to pop music broadcasting save for R. Luxembourg.

The station I heard and listened to most nights was the offshore pirate Radio Caroline. They had one of those CH6 rigs, a RCA 50Kw Ampliphase transmitter down in the hold and a full-size 5/8 antenna tower up on deck. Tallest tower ever fitted on a sea going vessel. The tx is still in the hold to this day, but on a different boat.

-=PEAKABOO=- wrote:

> I believe that if installed right and the equipment is right, modulation kept at a respectable level, you could get away with a small broadcast station, but a lot of that will depend on the neighbors equipment as well. A lot of computer speakers with built in amps for instance, have roughly a 9' wire feeding the speakers, hell my speakers had 6 wires, 4 to the speakers (5 speaker system) 1 to the volume control and the power wire...all of these were 9'2" long, what a joke. Man you could bleed on those speakers with a walkie talkie in the front yard. A handful of .01's and a handful of ferrite beads and it is now bullet proof. I wish some of the equipment built in this and various countries would get the same treatment, maybe we would not have such a problem, the government had to let employs go because of the budget, no wonder with all the complaints, and to think that this probably could have been cut in half if they (FCC) would just enforce the laws on the filtering required on the electronics nowadays.

Exactly! No matter how "clean" YOUR station is, with enough RF floating around, you're bound to cause havoc with some cheap consumer electronics. Computer speakers are a good example. In order to eliminate interference, you have to do something to the problem device. Which can be a can of worms should anything ever happen to any neighbor's device that you "worked" on. Which is why I refuse to do it.

I gave up with my interference problems. I resolved myself to running 100% legal, with as clean equipment as possible. If there was still a problem, then call the FCC. I'm not going to take the brunt of some 3rd world country's design flaws.

As long as people buy those cheap phones at Radio Shack, and have a houseful of other electronic widgets, you'll have no end to problems with interference complaints.

I'm hoping that my new location fares better. We have underground utilities, I'm running the coax underground to the antenna (in conduit), and still running legal power. Time will tell once they finish building all the new houses around me.

A lot has to do with what frequencies you are running. I have a ham friend that can run 1 KW on 80 and 40 meters, and not bother anyone. But run 100 watts on 10 (or 11) meters, and he destroys the neighbors.

A "clean" CB should be no more prone to RFI than your Kenwood.

Who needs "Melrose Place" when you have a scanner? My neighborhood phone traffic was no less juicy at times. Teenaged girls talking about their first time with sex, wife talking to newly found lover while hubby

watched Monday Night Football in the next room, guys making drug buys,
and even caught one neighbor bitching about ME and all my "radio stuff"
to another.

It's fun to try to figure out who all those voices belong to. Sometimes
more entertaining than TV, becasue it's REAL......

Big point. Narrower bandwidth equalls less interference and less noise,
resulting in better sensitivity. Most ham rigs have a "nromal" filter of
2.5 - 3 Khz and a "narrow" filter of usually 1.9 Khz. The audio fidelity
is much more muddy sounding, but your ability to copy the station
through the noise and adjacent interference is greatly increased. Notch
filters also help to remove adjacent signals

> I do agree that some SSB receivers have less than excellent
> selectivity though. I've never heard of narrow-band AM. Given that the
> the average bandwidth is going to peak at 6kHz, I believe it prudent to
> have the filtering designed with that in mind.

Normal communications quality AM is 6 Khz wide. Narrowing the bandwidth
to 4 Khz, will accomplish much the same as it does for SSB when you use
narrower filters, namely an increase in signal/ noise ratio. The
tradeoff, as with SSB narrow, is reduced audio fidelity.

> If it were SW

This technique is just a more flexible implementation of the narrow
filter concept. When both are used, the results over not having the
capability is awesome.

>
> > - Low-noise design in receiver front-end.  Some triple-

> down with relatively little filtering.

For optimum noise figure, the first device in the chain must be a high gain, low noise device. I subscribe to the school that says to amplify early, to avoid generating interstage noise with additional IF sections. Having a low noise RF amp gives you the best noise performance. The down side is subceptability to front end overload and desense. That is why it should be switchable.

You'd be surprized at how many VHF ham rigs that STILL don't offer CTCSS decoding as standard equipment. Encoding is usually standard though. I'm also surprized that more rigs aren't offering DCS. It's not exactly brand new....

I've recently "inherited" a Galaxy DX-55V. I've had mostly Cobras, a couple of Unidens, and a couple of Realistics during the course of my 9 years in the hobby. Of the three, I've been impressed with the Cobras most of all. I'm not very familiar with the radio though I've heard of the name. Would it be considered a keeper?
It has been peaked and tuned which is something I've never done or had done to any of my previous radios.
I installed the radio in my pick-up to try it out and after checking modulation, wattage, and SWR I found that at 6 watts dead key the unit will swing 27 watts at full modulation. I also found that the SWR was higher with this radio than with the Cobra-29LTD, relatively speaking.
With the Cobra, my SWR reads 1.2:1 on channels 1 & 40 while with the Galaxy, my SWR reads 1.8:1 on channels 1 & 40 (same frequencies). I'm using a Doczy DE-1000-3. Any ideas on why the difference?

Prob. due to the diff. in output power. Also the Galaxy may be tuned
diff. from the Cobra due to the several bands of channels and not
matching up as well to your antenna which is more than likely set for
the regular 40 channel band. Even though you are on the regular 40
channels when you test the swr, the radio could be peaked for another
band causing the higher swr. Not enough diff. to matter.

Thanks for the tips - I can see why you miss San Diego, it is a very nice area.  I'm in law school though, so I have not been able to see much of it yet.

-Hey, while you lived here, did you ever experience weird stuff on Channel 23 when you drove around the Lockheed-Martin Space & Naval warfare center near Old Town?  I was over there the other night and heard some weird noises on 23 when I was about 200 feet from the complex.  Expecially a loud beep that occurred at 10 second intervals.
No voice traffic though.

I have a Realistic TRC-212 (21-1662) for sale.  This is the full size
40 channel unit with carrying case.  High/low TX power switch.  Around
5 watts output on high.  LCD display with TX and receive meters.
Great shape. Original long (around 5 feet) center loaded antenna.  Has
external antenna, power and charging connections.  Has an 5-pin
external mic connection as well.  Uses 8 'AA's or 10 'AA's
rechargeables and you can recharge the batteries WITHOUT taking the
batteries out. (Batteries and charger not included)

Asking only $ 40.00 plus shipping.

A Picture can be e-mailed.

Homer

OK :) I will go on a quest for knowlegde- I would think its either a car
from the muscle car era or something from overseas.... I will find out
sooner or later.

I have a new Palomar 225 blue face. The other day I had it on high for the first time and got a report that I was squealing. I played around for a while and found out it only squealed when my headlights were on, it was raining. It only squealed when in high. I have the amp wired with the accessories under the dash. SWR was good when I hooked it up last week. I don't know what caused it. HELP!!!

I want to know how to increase the B+ forward voltage
shift on the collector of TR-51 during modulation in AM mode.
I have measured this voltage several times during my explorations
of this circuit and have found that during an dead key no modulation I
measure @ 4vdc, when the tx is modulated the voltage shift
increases @ 2.5-3.0 vdc on the collector of TR-51. total
of 6.5-7.0 vdc is applied to TR-44 collector.. I would like
to inccrease this voltage shift to TR-44 during modulation
to @ 10vdc. total. that is to say from an dead key voltage
of 2.5-3.0vdc to 10.0vdc forward shift when modulated.
does TR-49 have to be modified for this to happen?.

more to come.

Regards.

That's the hard part--pretending not to know.  I had a similar thing occur. I was on the same channel with a cheating housewife/neighbor. She lived on the street behind my house. When I was out in my shop at the rear of my lot, her "base" covered up mine and I could hear both sides of the conversation via my handset.

I've since moved, and I upgraded to 900 MHz, so I can't give you "The Rest Of The Story".

Had the exact same problem and I did the exact same thing to remedy
it, although I had already wasted about 2 inches of cable before I
tried burning them.  Those tiny wires are a bitch to strip with any
tool except a lighter.

Try reversing pins 2 and 4 on your mic plug. What ever is on pin 2 now put
it on 4 and vise versa..........

Mike

>Rules for CB'ers aren't being lobbied for by hams. The Ehlers Bill and similar legislation was born from interference complaints by average citizens fed up with having to tolerate their local 27 MHz splattermeister and getting little or no action from the Feds.

The problem with that bill is that it will render the legal 4 watt CBer at risk of being harrased by local law enforcement.  A 4 watt CB can cause interference with all the cheap consumer electronics products around, and more on the way since we love China so much, that local munincipalities will use this bill as a springboard to issue cease and desist orders to legal CB users who are causing interference.  The consumers will win in the end with this bill.  Not to mention the ability for police to use the mobile antenna as an excuse to pull a person over and check their transmitter for type acceptance.  But, we know the real reason that they will be pulling the person over, they may just not like the way the person looks. This will go for hams too.  Of course if your legal you have nothing to worry about with regards to your transmitter, but you are now the subject of indiscriminant harrasment.

Sean, I had busted this story a few months back and not many believed me,
and as they say  " the truth will set you free", well it shoud set many
souls free now.  and to all the sorry suckers who denied it  remember this
you heard it hear first baby,  I am many things but a liar I am not. It has
been said 151 ripped him off well it comes as no suprise to me as you can
see the backstabbers will be just that they fucked dave over so what makes
you think they would'nt fuck each other over. So who ever wants to get
fucked step up to the plate and pucker up  because x force is handing out
fuckings for christmas.

"Davemade til the End"

If they are on the same cable service he can. It can enter the cable system
and travel the line to many other houses at many miles away. A walkie talkie
can do this if the conditions are right or rather not right with the cable
company's equipment. Poor cables or connectors are usually to blame for
this. Call the cable company to have them fix it.
Mike

And what Kind of pot would you call heavy duty? I think it should be like
this..... High, low switch and use you variable on the radio. The high low
switch will only control modulated output, in other words a switchable
input pad, Then use the variable on the radio to control your carrier BUT
keep in mind that the resistors you use on your input pad will go just as
fast as the pot, Unless they are large enough, you can also heat-sink
these resistors, kinda like messenger did with their diodes in their bias
circuit, just for added security.

Solar cycle ups and downs continues to mystify scientists - Solar
activity
is picking up, but not as much as one team of scientists had predicted.
"The sun is a variable object and there are going to be some ups and
downs,"
says NASA's David Hathaway. One 'up' he doesn't expect is a large
eruption
predicted nowhere except in the rumor mill. Full story:

Mic wiring: http://www.copper.com/micwire.html

Your freq counter will read right when there is NO modulation. That
may require you to turn down the mic or the mic gain to read it.

Does anyone know if Sams made a set of photofacts for scanners? I am looking for a set like the radio series but I do not know if any of these were ever made. Like a complete volume.  If anyone knows if this set was made please let me know how many books were in the set and what the actual series was called. If you have a set for sale or some of a set please let me know. I went to the Howard Sams site and did a search for some scanners that are older and should have been in a book if they ever made any and the Sams search engine came up with nothing.  Electra Bearcat 220 and 210 should be

in these books if they were ever made but I had no luck. I even went further back to the Electra Bearcat 3 crystal type. Still no luck. I do not want to order each schematic from Uniden as they are not as nice as Howard Sams produce. No test points with voltages ect.  Anyone have any info please let me know.
Thanks,
Mike

You might be getting some kind of electrical noise from your hook-up spot. I would run your positive wire directly to the battery and run the ground to a good seperate ground on the body or chassis.

I was about 13 years old when I was introduced to CB by my next door neighbors wife. I used to rendezvous with her after "Mr. Pillar" went to work. She bought me a walkie talkie and I was to turn it on at about 6:00 or so and when the coast was clear I would receive a call from her. This worked very well for a couple of years and no one was the wiser. I moved from  that part of town in my sophomore year of  high school and the walkie talkie didn't reach her house from my new location so I bought my first CB radio (a globe cb-100). I was back in business, so to speak! The globe came with only one set of crystals (ch 14 to match the walkie talkie channel) but had positions for three. After a few weeks on the paper route I was able to purchase 2 new channels. I purchased channels 13 and 12. Listening to the other channels for a couple of days I was dismayed to find my "woman" in a heated conversation (much like the ones she had with me) with one of my classmates. I never spoke to her again. Years later I found out there were several walkie talkies in our development all with different channels installed... Mrs. pillar was a very busy woman.... I learned alot about radios  and other things back then!

I use a T-Stripper made by Ideal. The red handled pair covers 16 to
26 gauge. The blue handled pair covers the bigger wire.

The schematic comes in the user manual.

A foldout blueprint.

It was built in New Mexico.

Good radio, but they are finicky.

If you ever want to sell one, let me know.  I had one stolen and I would like to replace it.

> A "clean" CB should be no more prone to RFI than your Kenwood.

Not totally true.

A stock, high level modulated CB radio WILL put out higher power in the harmonics due to the fact that it uses non-linear circuits in the final and driver section and they don't filter them as well as the should.

In a low level modulated radio, all the RF stages are run with bias and cleanly.

No, the correct answer would be twofold...

Run BOTH the positive and negative from the amp to the car battery....

AND

Fix the problem with the ground loops in your vehicle...

You can purchase the same thing from Uniden if you ask them for the one for the Grant.

Cobra says they are no longer available because it is a Uniden part, and they severed ties with Uniden.

If you are using a cable converter, you can usually ask your cable company to give you a different model, if they provide those because the harmonics and bleedover are tremendous on certain converter channels (channel 18 being the case in my city)

I live in Puerto Rico and I'm bulding a system for my car. I have installed a powerline 150 amp alternator along with my stock alternator to power an amp with 2 8 volt bateries. How big a box could I run efficiently on that setup? I have an xforce 3 pill for a driver. I was planning on running an 8 pill with this setup.

Thanks

Andres

I would say if you dedicated the 250 alternator for that 8 pill, you should be okay..... Should get some decent power out running 16 volts.... You do have your regulator putting out 17.3-17.6 volts right?

The 8950's are used in Siltronix and Swan equipment. They are somewhat hard to find, and usually go for about $75-100 APIECE for N.O.S. tubes.

> " the truth will set you free", well it shoud set many souls free now.  and
to all the sorry suckers who denied it  remember this you heard it hear first
baby,  I am many things but a liar I am not.

Those whom accept rumor as truth shall suffocate in a pool of ignorance.
A liar you may not be, but misinformed you are.
123 is still an integral part of X-Force and filling customer demand. While the
former Dave customers are coming in droves to buy X-Force, not only because
they can actually supply the demand, but also give superb quality and customer
service.
And yes the truth will set you free. It's ok, you can admit to us that you too
own X-Force products.

HAHAHAHAAA..... had to crack up at this one, ICM.

As it is, try the address posted for Don's CB.  They will have the factory
bulbs and just about any other RCI / Galaxy part that you may want.  If not,
they can get it.  Sean

Uniden Washington base stations are in the 2000 Radio Shack catalogs.
I have one, did not buy it from Radio Shack, and it makes me want to
puke to see Rat Shack selling them.

SSTV or Slow Scan is used on the HF freqs., but it is also being used on VHF (2 meters) in this area. Some of what has been described here (cable ready gear etc) is for the UHF Fast Scan which is like regular TV, and is usually on 432 mhz and 900 mhz. As for SSTV, you can download a program, use your sound card, and a Shortwave receiver and be able to watch SSTV from the Hams on 20 meters. AS for sending, it will require a transmitter capable of that freq, and another hookup. Search the web for SSTV, and you will find a number of pages which describe it, show pictures of it, and info on the actual use. SSTV is slow, but it is fun.

I don't want to start a pissing contest here, but most AM/SSB radios, even the high level ones, keep some bias applied even in AM mode.

But even considering what you stated, the radio still has to pass rigid spectral purity tests to conform with the tech standards for type acceptance. Harmonic content in any case cannot be any worse than -60dbc.

If the radio is stock legal, it should be very clean. Of course if the mod limiter is clipped, and the modulation looks like a squarewave, then I'd agree that that radio is no longer "clean" and will be putting out harmonics.

Three words:

GROUNDING, GROUNDING, GROUNDING.

Most squeals are caused by RF feedback. If the radio AND the amp are both solidly grounded to the vehicle chassis (and I don't mean running a 6 foot wire and tying it the seatbelt bolt), you sould minimize your squeal problems.

If you're running a mag-mount antenna, get rid of it. A direct grounded antenna is much better at preventing "floating" RF than a capacitive ground mag mount.

I have a Cobra 148 that sounds like it is off frequency on receive. Any ideas which coils could be adjusted to get it back? It has just started this, and does not matter if it is warm or cold. It is used mobile, and missed very much. I have played with the clarifier, and it soesn't do anything for it, and I have switched channels trying to see if it was that far off, but it doesn't make a difference. Any help, or diagrams and specs would be greatly appreciated.
Thank you,
Paul Munsel

I Have the following for sale....

-a Uniden Grant LT...new model with dynamic squelch control and backlit display..has x-tra channels mounted in cb/pa-brt-dim...radio has been peaked and tuned and has 6+/- open clarifier..all work has been done personally.comes with box and all original hardware and paperwork. best reasonable offer. (will install r.beep board for a few bucks x-tra)
-a Shure 526T desk mic..very powerful,great sounding ham mic.sells for $125 new.has black marker on key button from freind's boy.cosmeticcally a 6/10.works great and is currently wired for the uniden grant LT but will re-wre for your preference.best reasonable offer.
-a silver eagle desk mic...looks and works great .will wire to your preference

if needed
-PDC-256 frequency counter...works on both rx/tx and is in great condition with
box and instruction...also includes schematic of 148gtl.best offer
-2 roger beep boards,one is a workman 5-tone roger beep and the other is a k&b
2-tone roger beep.best offer or will install in grant if asked.
-Cobra CA-76 power mic..works and looks fine...is currently wired for 148/grant
but will wire to yoy likeing if needed.best offer.
-Ameco PT-3 Receive Preamplifier...looks and works brand new works from 1.8-54
mhz..great for shooting skip.best reasonable offer.

email me directly if possible thanks an 73's

Hi, all.

I have an unusual (?) request for a
modification for my Cobra 148.

In SSB mode, the knob for fine tuning
the receive frequency is too sensitive.
By that, I mean that even a small turn
often takes me past  where I really wanted
to go.  I'm constantly trying to fine-tune in
on a signal I'm receiving and usually over-
shooting the adjustment.

Is there a way to change the adjustment
rate of this knob?

Thanks in advance,

Bryan

Dave --

Thanks for the suggestion as how not
to ground a radio or amp.

What do you advocate as the best
way to ground one?  I'm curious as
I'd like to make sure my installation is
good.

Thank you in advance,

Bryan

Do you have any Ideal how dumb you look? Or is that the reason you keep
changing your screen name. Why is it that the best boxes around are always
the boxes some on is trying to get rid of. Man if you where selling Dave
Made boxes they would be the best thing around. Get real the only people you

may be influencing are the people that don't know better. You might sucker people to buy your products but sooner or latter they will find that they have been burned and you know who they will point the blame at? No not the amp company they WILL point at you.
Keep selling that junk. I see your not worrying about ruining your name since every time you come here you post under a new one.
I don't make money off of my words I speak the truth. Dave Made Doesn't not tell me what to say nor do I get paid for what I say.
I guess my point here is how can you trust an opinion on a guy that only sells select products.

Bite both sides of the burger before you say you didn't get a pickle..........

Thanks for all the info guys. Here in Puerto Rico we are starting to get
into high power mobiles and keydowns, I want to make sure I have a good
setup on the 8 pill for competion. I/m planing to run a variable regulator
and run the 8 pill at about 17 volts.

Thanks again,
Andres

Please read all of this post.

1.  I have a WORKING Realistic TRC-458 which is a 40 channel CB base
AM/SSB radio that I am selling for a freind.  The radio has some
scratches.  Has NEVER had any extra channels put in it.
Great radio, as it can do over 200 channels.  Info on the net.  It has
the 858 chip.
Full service manual included (a $ 25.00 value) and a brand new
separate 858 chip (spare).
Sell both for $ 75.00 plus shipping.
Picture avaliable for the TRC-458 ! ! !

2.  A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

no mics

Please reply to email as I do not often get to this newsgroup.  He
wants to get this stuff sold ASAP, so please reply ASAP.  I will reply
to you from Monday to Friday only.

Thank-you,

I don't know.  I bought the CB from a
local CB shop.  The guy behind the
counter said it had been modified, but
exactly what was done to it, I don't know.

Thanks,

Bryan

A little old lady wanted to join a biker club. She knocked on the door of a local biker club and a big, hairy, bearded biker with tattoos all over his arms answers the door.  She proclaims "I want to join your biker club." The guy was amused and told her that she needed to meet certain biker requirements before she was allowed to join.
So the biker asks her "You have  a bike?"
 The little old lady says "Yea, that's my Harley over there" and points to a Harley parked in the driveway.
The biker asks her "Do you smoke?"
The little old lady says "Yea, I smoke. I smoke 4 packs of cigarettes a day and a couple of cigars while I'm shooting pool."
The biker is impressed and asks "Well, have you ever been picked up by the Fuzz?".
The little old lady says "No, I've never been picked up by the fuzz, but I've been swung around by my nipples."

A woman went into a department store and told the clerk that she wanted to return a toaster for refund because it didn't work.  The clerk told her that he couldn't give her a refund because she bought it on special. All of a sudden the woman threw her arms up and yelled, "Grab my Breasts!  Grab my breasts!" The clerk didn't know what to do, so he called the store manager who asked her if he can help. She explained that she wanted to return the nonworking toaster for refund, and he told her that he would not give her a refund because she bought the toaster on special. Once again she yelled, "Grab my breasts!  Grab my breasts!" The manager was taken aback and asked her why she was yelling that particular phrase. She replied, "Because I like my breasts grabbed when I'm getting screwed!"

If you swap the microprocessor of the HTX-10 with one from the Realistic (Radio Shack) TRC-485, this should make the HTX-10 useable on 10 AND 11 meters. The processors are IDENTICAL except for the HTX-10's not  having the 11 meter band burnt into its processor's memory
  No,..I've not tried it, but have service manuals for both, and both indicate this is correct....>DAM please read past post.. there has been 50 of them .. no there arent any
>mods for it you cant mod it.. the rig was made for use only on 10..

I agree with what you are saying, wholeheartedly, but what I was saying was that this petition would take it away from land / mobile radio service and turn it to lean towards hobby bands...

You will also notice that their isn't another land mobile service below 30 megs.

Toll Free

Duracomm power supplies are (or was) sold by:

Duracomm Corp.
2119 Atlantic
North Kansas City, MO 64116

The Company is/was owned by John Fuhrman. I believe he is (or was) a HAM. I have one of his switching 22 amp power supplies and it has worked great for me for a number of years and is still in use. When I first got it, it had a lot of noise which I could hear in my receiver. I wrote John about it and he had me send it to him. He totally cleaned it up, and sent it back to me at no cost to me. He is a great guy, and his power supply has never failed me. Oh, the little switching power supply that TenTec used to sell for the Scout was a Duracomm, so I have been told.

I don't know if he is still in business. I have not heard from him in a number of years.

Your 8 pill should do fine with that set-up.  Run the radio and driver off of the stock alternator and the 8 pill off of the dedicated high voltage system.  You might get away with a 10 or 12 pill, but it would be stressing the electrical system if you were really getting down on it.  Just make sure that the box your going to run will handle the increased voltage.  Better make sure the antenna system is up to snuff too.  Sean
>

andres wrote in message ...
I live in Puerto Rico and I'm bulding a system for my car. I have installed a powerline 150 amp alternator along with my stock alternator to power an amp with 2 8 volt bateries. How big a box could I run efficiently on that setup? I have an xforce 3 pill for a driver. I was planning on running an 8 pill with this setup.

Thanks

Andres

Technicality, but how about the 500?  I have one that I'm going to install when I get around to it (I know that's vague, it's been a month so far).  Is there any point where there is a risk of damaging the pot in this amp?

Just curious.

Could be several reasons for this.  The radio's output stage may be

something other than appr. 50 ohms due to hairbrain modifications. These hairbrain mod's might also be causing the radio to produce harmonics ( out of band "splatter"). The antenna is not tuned and will not accept the frequencies that the harmonics are generated on and it therefore shows up as a higher swr ( increased reflected power). Just guesses though...... Sean

I've recently "inherited" a Galaxy DX-55V. I've had mostly Cobras, a couple of Unidens, and a couple of Realistics during the course of my 9 years in the hobby. Of the three, I've been impressed with the Cobras most of all. I'm not very familiar with the radio though I've heard of the name. Would it be considered a keeper?
It has been peaked and tuned which is something I've never done or had done to any of my previous radios.
I installed the radio in my pick-up to try it out and after checking modulation, wattage, and SWR I found that at 6 watts dead key the unit will swing 27 watts at full modulation. I also found that the SWR was higher with this radio than with the Cobra-29LTD, relatively speaking.
With the Cobra, my SWR reads 1.2:1 on channels 1 & 40 while with the Galaxy, my SWR reads 1.8:1 on channels 1 & 40 (same frequencies). I'm using a Doczy DE-1000-3. Any ideas on why the difference?

If it has a variable pot on the front, it will not last if you over drive
the amp, if you are going to drive the amp with another smaller amp you
will need to do away with this pot altogether, But I dont suggest driving
the amp without some changes.

Was it base or mobile ???

Either way, it would cost a FORTUNE to re-tube it.  I passed on one of these
due to the MAJOR amount of work that needed to be done to it.  Unless you
can locate a ton of M2057's or 8950's at a good price, forget about it.  It
could be converted to run other tubes, but that's a whole nother story.
Sean

I got a phone call from a friend on this one.
Said he saw it in the newspaper.

Can you tell me what tubes are in it ??
What deadkey should it have ??
What would be a good used price for it ???

Sorry to be asking all these questions.
I would like to know a little about it, before I call.

Thanx
Randy

If you only knew.  Believe me, it doesn't take a million watts either...

We had a local guy sit in front of the Satellite dishes for a local cable company.  His audio was transmitted across EVERY cable channel within every community that this specific cable company served.  They had thousands of complaints pile in, not only to the cable company but also to the local Village Hall.  Yes, it was REALLY dumb and could have brought the FCC around PRONTO.  Then again, nobody ever said that cber's were smart or thought ahead......

PS.....  PLEASE don't do stupid stuff like this.  It will only make matters worse for all of us.  Sean

I think one of the reasons the pots lasted on say your m-80 is because he uses a 100 ohm resistor to " absorb" any rf that would normally overload the wire in the pot when you turn them down, although they to will fail under extreme conditions. I do have to say that Dave's variable design is a good one, I have seen a lot of other people copy it, I have used it before as well. damn good design.

While i don't know the specifics about 123 departing X-Force ( and wouldn't
go there even if i did ), the bottom line is performance and quality.

I spoke to Carl aka Freebird today and he told me that they will stand
behind their products and are here to stay.  If your having problems with an
X-Force, please contact them directly and let them know.  Sean

Okay "smart guy", you knew what i meant.   :  )

As it is, i don't know too many other straight 8 pills that a barefoot radio

```
can drive to respectable peak levels.  Then again, this is a tribute to the
efficiency of these amps.  Sean

I would call the TS 12gauge and Sweet 16 high drive anps.

These would truly be HIGH DRIVE, but they do not call them high drive,
they tell you that they require a driver.

Greetings!

Nope, thats not even what I was talking about...

Please re-read those posts.

SSB mode was not entirely discussed.

The only section I was focusing on more - was the AM Regulator.

I'm sure that many people got their signals crossed on this. I wasn't giving a dissertation on SSB, only the involvement of the AM regulator while in SSB mode.

There are three posts from me relating to the AM regulator, I don't know how the SSB carp got into this - except for what Bob interpeted.

Which is not to say the interpetation was wrong, just skewed...

For some radios, the AM regulator produces Modulation for the AM side. When in SSB the PLL offsets the IF input to the Balanced modulator, buth the radio board I'm talking about, the PB-122 - the Balanced modulator is used all the time. It produces a carrier thru the audio IF x-tal filter, that when offset by the PLL control, one or the other envelope for audio is passed thru.

This is whats occuring in a PB-122 based board. You see both center [carrier] and audio sidebands being produced. But little audio passes thru from the Balanced Modulator while in AM mode - looking at the Audio IF section output. It's simply "center slot-ed" for IF and the crystal filter is removing both audio sidebands as it passes thru the x-tal filter - leaving carrier and some low end envelope.

It's the way it's designed to keep it simple and why the AM regulator has a tap on it that goes to the mic-amp section. To Uniden and Cobra, this is the down and dirty way of doing things, and why an NPN 2SC945 drives a PNP 2SB525 and the 2SA1012.

The PNP's are "paired" for form a Darlington Pair amplifier - to handle the AM power, and AM mod produced thru the 2SA1012. It's doing all the work on AM - with the balanced modulator simply providing the carrier [which does contain audio before filtering] IF to be mixed in the TX front end section with the PLL's offset IF.

It keeps down the amount of switching the radio has to do, both the Balanced Modulator and AM regulator section still work together in all modes of the PB-122 style boards. Thats whats so neat about it.

It really doesn't matter if audio is low-level modulated except when in SSB mode, so filtering is kept the same, only shifted. The Mic amp section feeds audio drive to the AM regulator and AM Mod amp along with AM power section supplies the audio and DB bias to drive the collectors while in AM.

In SSB the AM power is cut off [biased off] but the Mic amp section can still affect operation and is used with ALC to "clean up" what would otherwise be dirtied audio from excessive drive and filtering done by the Balanced Modulator and Audio IF filter x-tal.

Thats what I'm talking about.

Uniden and Dynascan simplified the design to where the Balanced

Modulator can be used to provide the Audio for SSB, and just plain old Carrier for AM - and the AM power section handles the Mic amp input to drive the audio with a regulated carrier.

You guys didn't know this?

While Dancing with the Mouse on Sun, 12 Dec 1999 20:58:30 GMT, the Modem interrupted with an MNI from "northwoods@mail.com (Dilon Earl)", and the MotherBoard buffered this to Video RAM:

Greetings!

It's a neat idea that has simplified things. But, it's like re-inventing the wheel. The only thing I can ascertain, is to "beef up" the output to drive a heavier signal for amplification. It's just more complex in having to use discretes that have to be selected to properly obtain what a IC has already done!

But, isn't that the function of the Balanced Modulator?

I believe the BM [no pun here] uses a PIN network to perform such a function for mixing and offset.

While Dancing with the Mouse on Mon, 13 Dec 1999 22:29:43 -0800, the
Modem interrupted with an MNI from ""Bob C."
<bob@bigbird.reno.nv.us>", and the MotherBoard buffered this to Video

Greetings!

The 77-285 - full blown with a lot of bells and whistles.

If you like the Grant, this isn't a "drop-in" replacement - it does have some flaws and maybe a bit noisy at times for your tastes but it does work well.

Smaller package - but then a PC76XLW/LT might do the trick better!

While Dancing with the Mouse on Sun, 12 Dec 1999 01:59:39 GMT, the Modem interrupted with an MNI from "David <dbsdave@my-deja.com>", and the MotherBoard buffered this to Video RAM:

:+> I'm looking at buying a new radio and being a "classic" big radio lover, I

Laying it on its side won't hurt it but taking it off and putting it
on the car once a day will probably cause fatigue in the case and may
cause a problem in the future.

Its not legal to modify a CB.  Whatever you do don't try to modify it
yourself.  It takes many years and many ruined radios before you get
the "touch."

I think this is splitting hairs - as one wanders into the land of obfuscation. If you consider that -any- non-linearity is going to generate harmonics I think Sean's blanket statement is quite correct. What is most important is that the harmonic content is going to change depending upon the matching of the output transistors. For instance, if they are perfectly matched yet there is inadequate bias, there will be primarily odd-order distortion products. In the case of CB, these are going to fall on thrice the operating frequency, or about 81MHz. If the transistors are biased up well into their conduction curve and drawing equal idle current, yet the two output devices do not have identical gain characteristics (this does happen, believe me!), the harmonic content is going to be primarily even-order. In this case, it'll be centered on approximately 54MHz, and I don't think I need to tell you that this is dangerously close to Channel 2 on your television and where your neighbors start to get involved.

> If the drive signal is not split equally there
> will be an imbalance regardless of the level of
> bias.

Not necessarily so. Remember the signal is not split or "halved" to each output device. They are fed with mirror images of the same signal. Ideally the amplitudes should be the same, but I think you'll find in many an amplifier they are not - this is particularly true of amplifiers with multiple output devices. You must remember that each halved signal, regardless of amplitude, is going to be pure.

> Bias and the input drive signal are separate
> entities.

Yes.

> You're more likely to have an imbalance
> with a biased amp because the bias to the different
> pair can be unequal. That can't be a problem when
> all the transistor bases are DC grounded.

I don't think I quite agree with this (perhaps because I don't fully understand what you are trying to say) The bias set point has no bearing on the conduction curve of the output devices and therefore has none on the linearity of these two (or more) components. The only time that it would have bearing is if the output devices were mis-matched. That said, in your typical illegal CB amplifier, the non-linearity problem is most likely caused by the saturation of the output transformer core. This results in even order distortion products. (see above). Said another way, having zero volts bias on the transistors does not perform any kind of matching function.

Joe, firstly, I have no idea what radio you are talking about.

It is possible, and common, to increase the drive voltage in a typical current amplifier used dynamically. A picture is worth a thousand words here. But I am limited to text. Basically what you want to achieve is increasing (or decreasing) the rail voltage of the previous stage. What this allows you to do it fully saturate the device driving the output device and therefore -pull- your output device to its own rail voltage.

To confuse matters further I've found a link.
http://www-us2.semiconductors.philips.com/pip/TDA1020

This is a very common amplifier used in audio (it is actually quite a good one too that I'm very familiar with). If you look at the block diagram on page 3, and then the sample circuit on page 7, you can see that the output is pin 2. You will also see that pin 4 goes back to the drive on the output stage. What you do is place a capacitor between the output and the "bootstrapping" input to bump up the maximum voltage that can be driven into the top output device. How effective is this technique? Check the specifications on page and compare power with and without.

You could easily apply the same technique to an emitter follower in a CB, but the signal must be dynamic - that is to say, modulated.

If this is too heavy for young players I apologize but I've tried to simplify it.

I have three CBs that I want to sell,They are all in working condition they are as follows
1 Midland  40 CH Model 77-104
   Includes Mike
    Condition  6
2 Midland  40 Ch Model 77-145
   Includes Mike and mounting bracket
   Condition  6
3 General Electric 40 Ch Model 3-5806A
   Includes Mike ,Bracket,power cord
   Condition  6
I am looking for $90 obo for all three shipped to your door

Thankyou & 73

Like I said thanks for all the info. Basically all I learned is that Texas
star uses shit in the boxes. I never had a variable on any amp of mine get
hot that is why I asked on this board not even Texas stars.

Hello folks. I would like to hear your thoughts and  technical
knowledge on which of these rigs are better, esp. for SSB use. The
Lincoln I'm asking about would be the latest one, with the "new"
squelch configuration.

Thank You,

Paul

An 8 pill would be the max you could use.  The driver would have to be on the
13.8 volts side.

If any of you guys been visiting www.bayshorenetwork.com you probably noticed that nothing is working properly. This is because I'm leaving angelfire and switching to my @ home network. This will prevent all the annoying pop up ads. Sooner or later I will be finished and all links will be up and running with some new stuff included. But I can only do so much a day since my free time is very limited.

If there is any thing you need or want access to such as links, mods, pictures, before hand let me know. write to webmaster@bayshorenetwork.com

Thank you!

Scientists "predict" the cycle the same way they have for a couple hundred years and the same way we can.Look at the progress of the cycle in terms of average # of visible sunspots per month and compare this to the closest looking cycle from the VERY SMALL group of data from the past.

Anyone(including scientists and the ARRL)who tried to predict the cycle before it was even 1/2 way to peak was a fool.

I predict a very weak and low peaking cycle,much like those of the Maunder minimum,I could be wrong.

My comments to some of your comments to my prior post below...

MC 10kW Jesus <qsl27@hotmail.com> wrote in article <385844B4.9530DE54@hotmail.com>...

[snip]

>> - At least a dual-conversion superhet not only for AM/FM receive modes but also for SSB (i.e., product detection done after 455kHz 2nd IF).  Triple-conversion may even be better for selectivity (although not necessarily for dynamic range).  Many of the radio block diagrams I've perused seem to only have single conversion for SSB, w/ product detection (SSB demod) occurring at 10.695MHz.
>
> I disagree. It is commonly held that single conversion receivers are the best for SSB work.

"Commonly held"?  Hmmm.  I don't know of any decent commercial/ ham HF rig that is not double conversion - if not triple or even quad conversion.  There's all sorts of things with which to be concerned here - esp. IMD.  The one HF rig I know of that has a single conversion receiver is the SGC-2020, a little $600 20W HF "survival" rig.  It did not get very a favorable tech review in QST (totally disregarding ergonomic issues).  Just didn't have good "crowded-band" performance.

Bill Sabin - of Rockwell/Collins fame - wrote the excellent Rcvrs & Transmitters chapter in the later ARRL handbooks. Really delves into a lot of the tradeoffs btwn receiver design variations. Recommended reading; going thru some of the math helps but you can still get a broad view by just going thru the textual material...

> The selectivity is accomplished entirely by the Xtal filter. So profoundly so that additional conversion stages can only add noise. If more gain is required, to make it more sensitive, this can be easily addressed without adding another stage of conversion.

Well, now, an xtal filter running at a high IF freq is gonna have a wide bandwidth - say 20kHz or so. So while of course useful up there to keep the IF amp(s) happy, you still need a narrow bandwidth filter at a lower IF freq. to get your 500Hz CW bandwidth or 1.8kHz - 3kHz SSB bandwidth.  A high-IF-freq xtal filter with a very very very low bandwidth would be tremendously expensive.

> > - Various bandwidths of *crystal* filtering at the 1st &
> >   2nd IFs. Should have AM narrow, AM wide, SSB narrow, SSB

> broadcasting that you are into, them I could justify a slightly wider
> filter. I don't believe that there is any broadcasting in this part of
> the spectrum. Well, there is in a sense but let us not go there right
> now. :->

Often SSB HF is run w/1.8 or 2kHz bandwidth. While voice quality
may be reduced, it is better than having all sorts of crapola
on top of it.  It is nice also to run narrower-band AM sometime;
while normally 6kHz bandwidth, you might wanna pinch it down to
around 4kHz in bad conditions (heterodynes, nearby signals, etc.)
During SW listening I sometimes switch to SSB and zero-beat the
signal so I then can take advantage of narrow SSB filters. Again,
voices aren't rendered as well but it helps cut out some junk...

> becomes a software issue now.

Yes, loop filters, quality VCOs, etc. are indeed important. However, single-loop/fine-step PLL synths that have any reasonable loop settling time for fast dial spinning have a fairly high amount of phase noise. Only in low-cost CB/10m world will you see such simple synths. This is why the cheaper HF rigs w/PLL synths of a few years ago often had notorious "chuffing" noise when you'd spin the dial. By having PLL loops with large steps, the noise is spread over a larger bandwidth, effectively reducing its localized effects near signals of interest. Even use of a dual modulus PLL chip can't avoid this: we are dealing with off-chip external design of the loop filters, etc. Major phase noise contributor is the fact that digital circuits *ain't*; they have analog characteristics. The programmable dividers and reference dividers don't have exact 0<->1 crossover points; different divider bits' flip-flops are slightly different from one another, vary w/temperature, etc. [It is difficult to make accurate chips.] So even a nice 100% "Grade-A" in-sync divided-down reference signal and divided-down loop signal have some errors during bit transitions that can pass thru loop filter and get to the VCO.

Yep. Really could use one on that little HTX10 I picked up from Radio Snack.

> that incorporate some of the features trailed on the ham gear.

Not all much money in the ham market. If they can make these items as afterthoughts to their commercial items, great. That's why you see so many VHF/UHF ham toys (HTs, mobiles, etc.) around.  Same basic radio but all sorts of frills.  HF rig market is costly to be in - far longer sales cycle, not a lot of (if any) corresponding commercial HF business.

> CB radios are cranked out like dung through a goose in some Chinese sweatshop by some poor slob who makes $3 a day. Incorporating all the lowest cost parts imaginable. If you think that the margins in CB radios are low, carefully study the financials of Uniden. I think you'll be very surprised.

Yes, they are. Even much ham gear is mfgd about the same way.

Uniden is a large co. that prob makes fairly thin margins on their CBs. It's the rest of their business that carries CB along, with CB leveraging some of their distrib. channel, parts supply, etc.

And if they were making so much money, their stock would be way up there.  Last business I'd wanna put my 401K money into! I'll stick w/Cisco, etc.

cash money you asswipe 22 in Michigan was ruunning a davemade too  haha You
are really showing you know nothing If you start selling another brand of
amp i guess they will join your ever growing list of the best boxes around.
. btw, X force is made by a bunch of white guys seeing as how you are
pushing amps made by some people of color thought you would like to know ..
what happened mr gunn turn you down? Or maybe he didnt give a discount

A good 200 amp leece Neville or equivalent  would run the 8 pill at what ever volts you want. If you prefer to go the other route then a bunch of batteries either series or parralelled will make up for the lack of alternator power.

Do you sell equipment on eBay and/or buy electronic stuff on accompany.com? Sign up for PointClick and get free credits towards these and many other online vendors.  You get $10 just for signing up and touring the site.  Additional credits accumulate as you tour the various merchant sites.

This is not spam, just a personal recommendation that I'm posting on a few of the radio newsgroups.  This one really works.  I'm well on my way towards a pair of FREE Motorola FRS radios!

www.pointclick.com

If you would, please list "surfinfordollars@aol.com" as your referral.  Thanks!

for am only the 2950 is a little better, but for ssb there is no comparison. the lack of reciever selectivity on the 2950 makes it real hard to qso on a crowded band when the dx is rolling. the 2510 is a good quite radio.

As the signal is modulated beyond 100% and the signal is switched between
being on and going into cut-off ( no conduction), large amounts of switching

distortion occur in unbiased amps.  This is clearly visible on a high
frequency scope.  Amps that have a built in bias circuit do not exhibit this
to any where near the extent of the un-biased amps.   Sean

*    There is a time when the rigs' carrier is going to be off during
*modulation when not limited to less than 100%. negative modulation.
************************

The carrier in AM large carier modulated signal will always remain constant.
So
that portion of the AM signal will always be present at the input of any
amp.
Thus the carrier will always bias the base/emitter junction of the
transistors
at a constant level.

regards
james

*************************

*    Not unlike SSB, when the drive gets below the turn on voltage of
*the finals there will be no conduction in the transistors. When the
*drive starts to rise, it must pass this breakover voltage to get the
*transistors conducting again. At this point you have crossover
*distortion as Sean said.
*    So, in essence, there is a part of the information lost in the
*crossovers when not biased right.
*                        BobC

How are you going to charge up that "lack of alternator power?"

Capt Coleslaw <8675309@aol.com> wrote in message ...
|A good 200 amp leece Neville or equivalent  would run the 8 pill at what
|ever volts you want. If you prefer to go the other route then a bunch of
|batteries either series or parralelled will make up for the lack of
|alternator power.

I normally hang out in the Harley group but thought this might generate
some interest here as well. BTW, I'm WA6ZGL, been a ham since '62 and
never leave home without my HTX-202, two-wheelin' or otherwise. Anyway,
have a look, ignore it if you aren't interested, take a whack at it if
you are, it's a good cause and hell, so far the price is right for this
stuff:

http://eddiekieger.com/~dkp/cgi-bin/ek3auction.cgi?ConsumerElec&946150248

Eddie's a friend of mine and sometimes all my hobbies merge like this.
All the proceeds go to the EKIII Charitable Trust Fund

Personally, I would take most ham rigs over many CB rigs. Just due to the cheap designs of the CB radios. Personally there is no CB or quote 10M rig slash CB rig that is worth over $200 brand new. Even the most expensive EXport rig has probaqbly less than $50 total cost in manufacturing it. I would not be surprised if the markup on these rigs fromth emanuafacturer is at least 200 percent or more.

*BobC writes:
*
*    There is a time when the rigs' carrier is going to be off during
*modulation when not limited to less than 100%. negative modulation.
***********************

The carrier in AM large carier modulated signal will always remain constant. So
that portion of the AM signal will always be present at the input of any amp.
Thus the carrier will always bias the base/emitter junction of the transistors
at a constant level.

regards
james

*************************

*    Not unlike SSB, when the drive gets below the turn on voltage of
*the finals there will be no conduction in the transistors. When the
*drive starts to rise, it must pass this breakover voltage to get the
*transistors conducting again. At this point you have crossover
*distortion as Sean said.
*    So, in essence, there is a part of the information lost in the
*crossovers when not biased right.
*                        BobC

Newer designs are also moving to zero-voltage switching or zero-current switching.  This could be a reason that they are less noisy.

Let me put things into perspective, Skipp. I've designed numerous power products and many electronic circuits. These designs have not won awards but they've sold successfully for the past six years - and are still very much current (no pun intended). Let me also put something into perspective. If you've ever used a cellular phone you've almost certainly benefited from one of my company's products.

I haven't the time to educate someone, like yourself, who already knows it all. I suggest you bone up on your SMPS theory.

MC

PS: Shielding is only the beginning of noise suppression. Try and think outside of the box - within the box.

You can use use a cable ready TV and a outdoor antenna to receive fast scan amateur on uhf. Tune channels between 55 and 61 with the TV/VCR set to "cable".

I was wondering if any one could give me a good explanation of how you program a PLL.  What does BCD stand for and how does it work.
Specifically the PLL UPD858C.  Any help, is more that what I have now..

I'm curious as to why you think the carrier is constant when there is applied a large negative going voltage swing from the modulator. I reference this to a hi level modulated rig wherein a transformer is used and the peak audio is not limited to less than 100% negative going modulation?

I say the applied audio voltage is able to negate the collector voltage for a length of time based on the degree of overmodulation in the negative direction.

This is pretty obvious if you look at the scope while reaching 100% and worsens as the audio voltage is increased. If you do this you'll see the carrier is off for quite some time.

Another point to make here is that when the carrier comes back up in amplitude it may have a pretty fast risetime (resembling a squarewave ramping up) which will create an undue level of harmonics and trash.

Steve.

Just a question... If you set the TV/VCR to cable, your setting it to tune VHF. How do you pick up UHF on VHF mode?

This type of activity with linear amps is mostly caused by low dead key.
Try raising the dead key of the radio a 1/4 of a watt at a time this should
cure your problem if your talking on AM.  However if your talking SSB then
this is probably normal.  In SSB mode it should click when ever you talk
into the mike and after.

It requires a soundcard and Internet Explorer 4 or higher. I've been talking on it for a few days and *LOVE* it. I just wich I could hook my old Palomar to my computer too ;-)

http://virtualcb.cjb.net

An old friend of mine told me about it last weekend... I went to the site, downloaded the plugin, and talked to him for the first time since he moved away 4 years ago!

Anyway, I thought you fellow radio buffs would get a kick out of this.

Cheers,
Chopper

You have it almost right.  Most Hams don't care what you do on your frequencies, but we "do" care what you do on ours.  I've been QRM'd by CB AMers and SSBers running mega-watts many times while trying to conduct a QSO via CW in the Amateur portion of 10 meters.  Remember that respect runs both ways.

Newsgroups: rec.radio.cb

I have two RCI 2950s for sale.

#1 - R285 has been replace with a diode and 100 Ohm resistor. This radio is setup to dead key 1W and swing to 16W with 100% modulation. I can remove this mod no charge if you perfer which would make it a stock 2950. I can setup the radio any way you want (assuming your request is within the operating parameters of the radio design). $125 with stock mic plus shipping.

#2 - Same mod as above plus Q52, the AF final driver for modulation, has been upgraded to a higher power transistor. This radio is setup to dead key 1W and swing to 18W with 100% modulation. I can remove the swing mod for no charge and setup the radio any way you want (assuming your request is within the operating parameters of the radio design). $140 with EMC Echo mic plus shipping. ($115 sans the echo mic.)

The radios can been seen if you are in the Metro Washington DC.area.

John

PEAKABOO,
>The link did not work.
You're right, it did not work.
I just came back from:

http://www.offshore-radio.de/

Than scroll through the gallery of all our ships.

R. Caroline has had several ships so start with the early pictures first.

From memory the tower was 163 metres tall, around 500ft!

PEAKABOO,

OK, the link above works.

Scroll down to the 'Gallery'.

Then a further scroll to the Mi Amigo.

You'll also notice the ex US navy ship which became the MV Galaxy from
which R. London broadcast. Click on the thumbnail pic.

Rgds

Phil / UK

the 2x6's, and 2x4's that are being built are being driven by 2-2290's where
as a 3 pills drive is proportional to the 2x4, 1-2290 for every 2-2879's.
you don't think the 3 pill is being driven to much do you?

I don't think the 3 pill is to much for the 8 pill, that is 1-2879 for every
4-2879's less than the smaller driver amps use.

Sean it could work with a standard 50 ohm line section Bird or coaxial
dynamics,
it could use a single or dual element, the single would of course not give
you the swr computation since the meter would not have the reflect watts to
compare it to.

Also, there is a jack that allows you to  parrallel your standard bird
analog meters with it to read the forward and reflect power on the analogs
as well as the digtal at the same time. This is good for those who still
like to see the needle swing on thier bird meter,  along with the ability to
see the faster response time of the digital meter.

Doesn anyone know of any modifications for the D104M6B mic.  There is
supposed to be mods for it out there....  Thanks

Richard

I am planning to buy a Cherokee CM-10 next week.  Has anyone had any
experiences with this radio, good or bad??  It is going to be installed in a
1998 Buick Park Ave.....

Thanks

I would like to know why swing is good.  Why is deadkeying 1 watt and swinging 15 watts better than deadkeying 5 watts and swinging 15 watts?
I would think the higher the watts the more power you would have.  Why would you want to deadkey next to nothing and swing so much?

I'm going to try explaining this in simple terms.
Am modulation it the difference between the peek envelope power and the carrier power. What do you think is a greater value 15W pep - 1W carrier, or 15W pep - 5W carrier?? If you can do simple math you will see the lower dead key gives you more modulation!! This often makes your radio some loader to your locals but choppy in DX.

its a good buddy goober smoocher thing. they like to see the meter swing. it doesnt really do anything. the carrier should be set at 1/4 the peak output of the radio. any lower and it sounds like crap to any radios with noise blankers on. some people do do it for a good reason, there trying to save expensive sweep tubes so they set the carrier at less.

Tim you are saying it doesnt do anything? , It increases the apparent loudness to the recieve station, I myself prefer some carrier and 25-50% of the total output is what I use for a carrier

ever heard the term "dick rider"??? you sound like you get a check from dave
himself. if you dont then your just jocking his style. be your own man. this is
nothing agaisnt you personally but everybody fights over these amps like there
the makers or owners of the firm. your 32 pill looked good and i'm sure it is
but that doesnt make you part of the dave crew. his amps arent the best around,
maybe they are for cb'ers but thats it.

>Dave Made often imitated never duplicated. I don't think the competition is
>going this mess with this.

Good luck and best regards from Tim 082.

What gives with the pulse tone on this freq. This used to be a great dx
freq with some great operators.  I have not had my radio on for a few
months(its a work thing) and now that I do this noise does a good job of
shutting down most of the communications.  Does antone know anything
about all of this???

Jeff

Tim, I guess you are also familiar with the term "Dick Rider"  You do alot of it Do you recieve anything in return for your advertising for the 11 meter DX news, or the other DX groups you list everytime you post. Does that make you part of their Crew? Does that mean I cannot root for Ford over Chevy without being a major shareholder of either company? He likes his davemades as much as you like your dx groups or talking on ssb. Its what ever your into.  I have read much better DX news reports, yours is not the best around maybe yours is only good for cbers and freebanders.

JUST FOR THE RECORD : THE ONLY THING I HAVE TO DO WITH DAVE MADE OR THE "DAVE MADE CREW" IS THAT I USE THERE PRODUCTS AND HIGHLY RECOMMEND THEM! I met concrete man in person a few times to buy my stuff but I never claim to be paid buy them, I don't claim to be part of them, If there is some thing I can do for them suck as taking a minuet out of my life to take a picture for them I will do FREE. When I need to buy an amp for me or some one I know I Call Concrete And buy it! that is it. Stop sending me EMAIL with you dumb comments I don't send you people Email I don't need you to send me Email..........

Hello Station53:   The Pride uses a 4CX250 or 4CX350 tube. And can put out 500 or more watts depending on what you drive it with. It is a AB1 class amp. I bought one for $350 and had to replace the tube for around

$125 dollars, but it certainly cranks. The tube will out last the sweep tubes by years. I saw one on E-bay go for just over $400 dollars and it was tore apart.

While I realize that this is not actually "radio equipment", I'd like to offer this equipment for sale or trade:

I have a Biamp (brand name)60 watt power amp and a Biamp "Advantage One" 8 channel microphone mixer for sale or trade.

Both are rack mount units. The amp was last used by a friend as a guitar amp to drive a speak for a recording session. Would make a nice small p.a., guitar amp, or perhaps monitor amp. The mixer was used to mix a set of drum mics down to a single channel for recording.

Will sell for best offer plus shipping (UPS about 15 pounds) or trade for ???  My interests are in ham, SSB CB, scanner, or musical equipment. Make me a reasonable offer.

Please respond by e-mail. If posting here, please send me a copy as I don't read the groups every day.

Thanks.
Jim, W8EMS/9

It's a waste of time. There is no advantage going over 100% modulation - plane & simple. Decreasing your carrier power will decrease your range - period. One thing to keep in mind that the carrier exists to demodulate the side-bands at the receiving end.

Why do people do it? Because it makes them sound LOUDER locally.
Many Psychological questions come to mind here.

MC

Sorry MC this is not the case decreasing your carrier power in no way reduces your range. A reduction in carrier power has no bearing on total output power  Let me ask you this lets assume we have 3 of the same amplifiers each capable of holding with audio  5oo watts rms power on am, Amp "A" is keyed up  at  200 watts of carrier and modulated to 5oo watts of rms power, Amp "B" is keyed up at 500 watts and when modulated holds 500 watts of rms power , Next Amp "C" is keyed up at 800 watts and is modualted back to 500 watts Which would have the greatest range or if all three keyed up at the same time which would be heard over the other and Why?

Many truckstops sell a little external talkback kit that plugs into the external speaker and PA jack (2 wires).  You then plug your external speaker into this external kit, which usually has a dial on it to control loudness.

Performance is marginal at best, but if you're looking for a cheap external fix, about $12 will get you one of these.

Roog

================================================================

Tim he is not the only one on NG saying that his amps are better , look at love you "dirty south" electronics he is selling foxiemades, scullkraka, and what ever else he could probably make a few bucs at.  Since there is a amp out here  that is a direct copy means he is telling the truth . Shit I was on a message board regarding football and 1 guy thought the dallas cowboys sucked and lovbed Indianpolis  a few other think the St louis rams are a better team this arguement went on for weeks it is no different with anything. People have opinions and can express them if they like.

promoting these helps me by making my

If a cable ready TV or VCR is set to receive cable, It receives a whole new
range of frequencies on VHF and UHF. Some are even in the FM broadcast band.
If you ever notice bad herringbone interference on channels 95 through 97,
It is usually caused by ingress from a strong FM radio station. Go to:
http://members.tripod.com/silatvg/cable.htm  to a partial frequency list
used to carry cable channels.
You can also vist http://www.ac6v.com/pagew.html#A for a lot of info on fast
scan (regular NTSC Standard) amateur tv.

it depends on what type of radio you have, like a cobra , for example. You could either (1)internally solder a 100 ohm resister from your PA joint to your Ext. speaker joint, and recieve talkback, or(2) you could wrap a piece of wire around your external speaker jack plug, and fasten the other end of the wire to one of your radio cover screws, and plug the ext. speaker in to its proper hole, and recieve talkback that way also. (like I said this depends on the type of radio that you have).

Here we go again. Anyone can go to nearly any frequency and listen, but you don't transmit. CBers don't give a rat's ass where they transmit. An amateur can and will lose a license if they are out of band and there is plenty of legal spectrum.

"Swing Kit" - Exceeds 100% modulation on the positive modulation peaks
(easily demonstrated on a "scope"), positive modulation peaks can and more
than likely will exceed 100% modulation without producing distortion.  This
in fact increases the amplitude or power output of the CB.

Swing Kits will increase modulation......which in turn make you seem
louder.....and despite this argument of due to lower
carrier....etc....etc....  I have a question for all of you I suppose....
who the hell hears someone's carrier when talking skip?!?!  Just a
question....

Take care.... Im gonna feel the love on this post..

I asked this once before but I pulled both deals(The protection diodes is what they are called I think) off the + and - right inside the radio and checked the ohms on them both ways and it was hi both ways on both the Pos. and Neg. The power was hooked up backwrds at one time and hasn't worked since. When I hook up the power wires I also have no power at the inside of the radio on the pos and neg poles before the diode things. Any help would be great. I have no good CB shops near me(Closest one is 2 1/2 hours away) Any  help would be great. Also, Is there a Radio Shack replacment number for the protection diodes if that is what is bad? Also, What else should I look for if any and how would I go about testing it? It is an older 148 without the SoundTracker.

Thanks in advance.

   Correct, we also look at the past few month's of activity to get an
idea of what *may* happen in the future. This cycle at the moment
looks as though it may be an average cycle, nothing spectacular.

>  Anyone(including scientists and the ARRL)who tried to predict the

   Pretty much. The Sun is still a mystery pretty much. There is a lot
we know and a lot we don't know. That's what makes it so interesting

```
and fun to study.

>  I predict a very weak and low peaking cycle,much like those of the
>Maunder minimum,I could be wrong.

    It won't be weak, probably average as things look right now.
Certainly not another Maunder minimum.

Just got this radio and tested it out (stock). On a DOSY, it deadkeys at 2.5 watts AM and swings to just under 4. This seems to be under product specifications (4 watts peak AM/FM). PEP on sideband maxes out at about 3.5, again under specs (6-7 watts PEP). Also on LSB, deadkeying gives about .5 watts instead of 0. Probably a mis-balance somewhere. Did I just get a dud? or has anyone else experienced this with this radio?

Thanks
-RC

Quite frankly, it was worded so poorly, and based on 'magazine logic', I didn't even try and deduce any intelligence out of it. (Much the same as an AM receiver can't deduce any intelligence out of a signal when there is no carrier present). And this is/was/shall always be my point.  -Swing- is a nonsense term and one can't make any hypotheses from an equation containing nonsense. I simply refuse to 'go there'.

Have a good evening and may Santa Claus bring you lots of toys!

Go to a truck stop if you don't want to mail order it. I see them for
$140 to $160 regularly. On the other hand, some shops sell them at a
higher cost and include their version of a peak and tune. Ask if
that's the case to see if it's something you need and whether it's a
deal or not.

I paid $120 for brand new unit a year ago. This was the sale price. It is a great little radio -
but don't ruin it with the modifications on the web. Email me direct and I'll send you some truly
useful information.

MC

I have a fair condition Realistic Navaho TRC-30A  (A.M. only)  connected to
a SILTRONIX model 90-6 V.F.O. (26.925-27.830)  and a 'modified' D-104 mic
(has agitator buttons/tones) that I might be interested in selling. What
would be a fair price for this set-up? Everything works fine. NOT for sale
yet...I'm just fishin.' And NO...I WON'T find a new fishin' hole!

Really? I have been buying them for about $35 each NIB.

Unlike the sweep tubes that the golden eared audio crowd has gone all "ga-ga" over - the 8950s have seem to have remained at a lower price.

If you hold a valid HAM license, you are a HAM where ever you go, in band or out. The only exceptions are if you licensed on a given frequency out of the HAM or CB bands.

Well Jeff... from MY QTH, I don't hear anything weird on  that frequency. It's just your typical  A.M.'ers  shootin' a little DX.  But I am in EXTREME Upstate New York, and Europe pretty much hammers me up until  2:00 EST. So...let it be known... I ONLY  DX  Europe.  Everything else is just 'local.' Including Africa. Go SSB, and find a 'clean' frequency. The WORLD is your oyster!!!

Jay meant that going form the A-99 or I-Max to the Maco ELIMINATED or
drastically reduced tvi and other interference.  My vote is for the Maco
also.

The Shakespeare Army stick is also a good antenna, but has the disadvantage
of not being tunable.  Sean

Scott's suggestions are all valid, but there is one that he left out.

Most "export" or ssb radios produce a square wave when they are fully modified. The abrupt drop off in signal can sometimes cause the keying circuit to chatter the relay, even though there is plenty of drive being applied. If this is the case, you need to add some capacitance to the keying circuit to correct this. Sean
>

Scott (Unit 69) wrote in message <385BF11D.E75AF0FE@hotmail.com>...
Low dead key.
Low power to the amp (small wire, bad connections, bad ground).
Bad coax cable.
SSB (push in SSB button to engage delay).
High SWR.

Decreasing your carrier DOES reduce your range IF the average power is also lower under fully modulated conditions.

Some radios can produce the same average power whether set for a 2 watt carrier or a 5 watt carrier.  Other's can't.  Whichever one maintains the highest average power and can fully modulate the envelope ( and then some ) will get out the farthest.  Sean
>

Capt Coleslaw <8675309@aol.com> wrote in message ...
Sorry MC this is not the case decreasing your carrier power in no way reduces your range. A reduction in carrier power has no bearing on total output power  Let me ask you this lets assume we have 3 of the same amplifiers each capable of holding with audio  5oo watts rms power on am, Amp "A" is keyed up  at  200 watts of carrier and modulated to 5oo watts of rms power, Amp "B" is keyed up at 500 watts and when modulated holds 500 watts of rms power , Next Amp "C" is keyed up at 800 watts and is modualted back to 500 watts Which would have the greatest range or if all three keyed up at the same time which would be heard over the other and Why?

MC 10kW Jesus <qsl27@hotmail.com> wrote in message
> It's a waste of time. There is no advantage going over 100% modulation - plane &
> simple. Decreasing your carrier power will decrease your range - period.
One thing  to keep in mind that the carrier exists to demodulate the

side-bands at the
> receiving end.

Birds ( peak or rms) don't read correctly in the fact that they don't typically show the " 4 times" ratio that is theoretically correct when talking about peak to average ratios and 100% modulation.  # 12's peak detector works better than Birds' circuit does and it's what i use a reference on my bench.

It was #12 that pointed out to the Bird Engineers that their circuit suffered from compression and caused them to redesign it appr. 1 1/2 years ago.  Bird did not advertise the fact that their design was "new and improved", as that would have been admitting that it wasn't right in the first place.  I pointed this out to Meritt, the owner of RF Parts at the 1998 Dayton Hamfest and showed him the differences between the two circuits. Even he did not know that it had been changed.  Sean
>

prozac 625 wrote in message ...
If you read his question you would know none of the choices have 100% modulation>
1.) Choice "A" would have to swing to 1000 watts for 100%
2.) Choice "B" has 0%.
3.) choice "C" is keying up with 800 watts and dropping down to 500 Not good!!

|
| I don't really understand your question but the amplifier with the

greatest
| carrier power is going to talk the farthest - assuming you have 100%
| modulation.
|
| If you're over modulated, which in your case you are, there is going to be
a

I can take an AM regulated dual final radio (Galaxy, Ranger, etc ) and have
it key 2 watts and swing 40 watts on a regular Bird 43 meter.  Would it be
loud ?  NO.  It would have 0% modulation.

Meters can be fooled.  Scopes can't.  Sean

I love the CM-10.  Great features, small package, and it looks good.  Very
clean output, and very good adjacent channel rejection.

Like the subject heading says, I'm looking to buy (or trade for) good compactron (12-pin), and novar/magnoval (big based 9-pin) sockets.  No PC mount, please!  Looking for reasonably priced saddle mount , small or large quantities.  I want to start playing around with my stash of compactron triple triodes and my sweep tubes.

Let me know what you have, what you're asking, and (in the case of a trade) what you're looking for.  I have tons of neat-o stuff, a miniscule portion of which is posted at;

http://members.aol.com/Reactor001

If you don't see anything you like, just ask...it's probably stashed in a box out in the garage.

Respond by email, please.

Regards,
Tom Mitchell

I'm interested in knowing what this thing will do, and what kind of
tubes.

The are usually found in an export model radio.  Prostar 400, Delta Force
Magnum, I am sure there are others.

Thats ok, these items have value to the collector looking for them. Some people who don't have time to go to flee markets will appreciate the fact that they are here for sale.

Besides, when you buy at a flee market you never know what you might get.

Check our local Radio shack too.  They used to have one.  They don't have a high performance rating.  But if you are looking for looks and savey then there you go.  It will get you down the road, you will be able to hear local information and road conditions.  You might be able to hear skip given the right conditions.

Make sure it is tuned after you install it.  That will net you the best results given then circumstances.  Also check you local CB Shop.  They might have one in stock too.

Happy Holidays

It would all depend on the voltage of the power supply.

```
volts x amps = watts

Sean that was the point in all of the examples the avg power was 500 watts, they all just had a different deadkey. Which would you assume would be the louder of all 3 situations? Since MC ducked answering it.

```

The mods for the newer ones are easier.  There is only on jumper to move and then add one in the previous spot or short it with solder. With this mod you get 26-32 band coverage.

Do you know how much current is being more less "occupied" when charging a battery, let alone 3 "cells" of whatever voltage...??? You are saying then a 200 amp should PROPERLY charge "a bunch of batteries" AND power your 8 pill...? Perhaps addressing how many batteries you had in mind.... god forbid this guy goes and buys 8 or more batteries.....

Thanks to all how posted on the alternator for the 8 pill. I also have another question. I have a Powerline 150 amp alternator and an xforce voltage regulator and was wondering if you guys had any info on hooking them up. The alternator has a battery pole and two other connectors labeled "R" and "F". I know the "F" stands for field but I have no idea about the "R". any info would be greatly appreciated.

Thanks
Andres

What the deal is......That amp comes with a built in power supply that can be used to power up a 13.8v device. You are a little off on this one my friend. You are thinking of the internal PS that is used to power the amp.....the PS in this unit can and IS designed to power external equipment also!

Won't the PS in ANY transistorized CB base amp power other 12-16 volt
devices? Mine have.

I imagine they would with no trouble but this unit has power lugs on the face plate for just that use. It is made to also be used as a power supply for other equipment.

I'd call it simple backswing, reflect watts resulting in burned radio and
box.

But correct me if I'm wrong. Has anyone heard of the "see-saw" effect? The more the swing, the less the modulation? The lesser the swing, the more the modulation? Or have I been out of the loop (or totally out of it for the past 8 years) and should be told to go sit in the corner now?

137... back out!

.....snipped.......

You have a decent radio there. The power is not great but most adequate. The modulation is very good when the limiters are either adjusted or removed.(your choice)

The only problems I ever saw from them was the PLL out of lock switching transistor would sometimes go bad and cause the radio to rcv or tx intermittently. I seem to remember this transistor would cause the tx to stop when modulated.

You could put a few extra ch.s in this radio pretty easily. I think it went to something like 27.585 or somewhere thereabouts. I think it also went a few ch.s below one as well.
BobC

Careful son. When a Hamster or a CBer goes "out of band" they then become a Freebander. Where they came from is not really relevant anymore. There's probably more freebanding going on than you imagine. I know of other frequencies well down in the SW spectrum where a host of illegal freebander operators run QSOs between the USA and Middle East. You just don't know what they're saying so you assume it's official business.

Sorry Coleslaw, it is. Hank Aaron (didn't he play baseball???) noted that swing kits exceed the 100% modulation envelope on the upswing - this is exactly what AM broadcasters do too. This with plenty of compression on the signal (applied not evenly but across different parts of the audio spectrum) and the station will sound louder. Transmit farther? I've seen no evidence of that.

Whether the the swing kits really do the same thing or not I don't know. But I suspect users run them on radios with the modulation limiter pulled anyway and therefore negate the whole exercise.

> Let me ask you this lets assume we have 3 of the same

So if one train leaves Chicago going west at 45MPH and the other east at 30MPH.......

I don't really understand your question but the amplifier with the greatest carrier power is going to talk the farthest - assuming you have 100% modulation.

If you're over modulated, which in your case you are, there is going to be a large part of the carrier that is transmitting nothing at all. How nothing can be more powerful than something is beyond the grasp this author. I encourage

you to run as much "mawj" as you want. I'll be the one making all the contacts
across the world, and you'll be the one making all the noise across town.  :->

1.) I would "guess A" because it has 300 watts of positive peak modulation.
2.) I wouldn't "guess B" because it has no modulation :ON AMPLITUDE
MODULATION THAT IS IT WILL BE GREAT FOR FREQUENCY OR PHASE SHIFT MODULATION.
3.) I wouldn't "guess C" because it has Negative Modulation.

I am not an Rf expert but this is the results of simple AM arithmetic.

If you read his question you would know none of the choices have 100%
modulation>
1.) Choice "A" would have to swing to 1000 watts for 100%
2.) Choice "B" has 0%.
3.) choice "C" is keying up with 800 watts and dropping down to 500 Not
good!!

Key up 800 watts and drop down to 500?
What do you call it?

Try this website... They have some good stuff at very good prices.. They are a wholesale
distributor and you will most likely get better prices.

we work europe here until about noon and then we get a mixter of southern
europe and africa until about 2. after two its starts with southern africa and
south america. by about 4 or 5 africa is gone and we start hearing the pacific
in our radios all evening until about 9 or 10 when it gets quite. once in a
while at night we will get some short skip with the neighbors in north mexico
about 500 miles away. all the guys bumping heads on the bowl or busy talking
local are wasting rf to me but hey, i'm a dx'er.

>Well Jeff... from MY QTH, I don't hear anything weird on  that frequency.
>It's just your typical  A.M.'ers  shootin' a little DX.  But I am in EXTREME
>Upstate New York, and Europe pretty much hammers me up until  2:00 EST.
>So...let it be known... I ONLY  DX  Europe.  Everything else is just
```

>'local.' Including Africa. Go SSB, and find a 'clean' frequency. The WORLD
>is your oyster!!!

Good luck and best regards from Tim 082.

Hello Sean:  Yes I corrected myself in e-mail to them. The spell checker wanted
to say "illuminated" and I meat eliminated. I went to the Los Angles City
School System, spelling in not a strong field for me. Let me know if ya need a
hot set of hub caps.

its called backward swing. you would rarely see this on the peak meters that so many cb'ers use. if a amp is putting out more than it should on am and isnt left with any head room you will see it back swing. thats why so many guys sound raspy and muffled. they may have there box on a peak meter thinking they have all kinds of swing when in reality on a rms meter there backswinging and sounding like shit.

Good luck and best regards from Tim 082.

I sometimes hear beeping sounds on CH 14 (27.125) around Baltimore.
Sounds more like a continuous roger beep.

The Cherokee CBS-500(AM) and CBS-1000(AM/SSB) base radios scan each of the
10 banks of 40 channels (1 bank at a time.)   They also have a dual-watch
feature.

I have a President for SSB work and I think it is the best there is.
Better than my Yaseu. I don't imagine the 2950 would be that much
different.

Time to chime in here a bit.  I have used both a normally modulated carrier and

a carrier with positive modulation via a swing kit.  The real advantage is when driving an amp.  Remember, you can only hear the differences between the carrier and the modulated signal.  In order to detect AM you need this difference and the greater the difference or PEP, the louder you sound.  Most amps are not linear in fact, if you look at the power curves for most amp transistors there is usually a small range over which the transistor is truely linear.  So, if you just slightly over dirve an amp you typically end up with modulation compression.  The way to solve this problem is to minimize the dead key and swing 6 to 12 times the dead key.  I have seen a 2950 dead keying at 1W and swinging to 16W driving a TX 667V from 80W to 300W.  Not very linear is it :-)  But the detectable signal is superior.  Of course, if you over drive the amp with too high a drive you still get compression and that choked sound.
Hope this helps.

John

i will sell you a bracket for a chevy . you can use 5 leece neville's with a/c or 8 without it. the price is $600.00. that includes the bracket only. you furnish the alternators and bolts, etc. i suggest grade 8 bolts for alternators. the way it works is that direct drive is applied to three alternators in the middle and you figure out how to drive the others. some people use indirect drive with double pulleys or some other configurations. this bracket is for use with chevy bolt patterns, say about 1987 or 1988 to 1991 , i think. this is for serpentine belt also. this is my own design, and i didn't copy from anyone else. thank you , thank you very much,........icm out....

I am going to use velocity to prove a point since it is much easier than Rf
AM modulation. Please note the concept is the same~

(A)----------------------(B)

Point T1, X1 = (0 Sec,0 Ft )
Point T2, X2 = (10 Sec, 10Ft)

Average velocity = Delta X / Delta T (right?)

now if you go from point A to point B and back to point A what is your
average Velocity?

Answer: 10Ft - 0Ft / 10 Sec - 0 Sec = 0 Ft/Sec

Are you telling be he didn't move?

Average is not very reliable.
You need to know calculus to find the Instantaneous values of Velocity.

That is where my $60,000 education came in to play!

The confusion in this conversation would be in the wattmeter's, What transmitter are you saying will do 50 watts? Most of the time when someone claims that their radio is doing 50 watts it is hard for me to believe. To make this question easier to answer, my question is this, What radio or amplifier do you have in mind?

Dear Timmy boy:
The story you just told makes no sense at all. There is not enough head room? What Book can I find that statement in? LOL
Let me explain the most common reason of over modulation or "raspy and muffled sound".
When people over modulate is has nothing to do with the size of the envelope signal. There cause is when you drop your carrier so far that the Negative Peeks approach the Zero (reference line on a scope) you will see that your negative peaks are flatting out at this zero mark or in other words the negative peaks are being clipped off.
You can key up 500 watts and swing to 10,000 watts this amount of swing doesn't make you over modulate if you have the proper equipment to give you that much swing.

| >its called backward swing. you would rarely see this on the peak meters
| that so
| >many cb'ers use. if a amp is putting out more than it should on am and
isnt
| >left with any head room you will see it back swing. thats why so many
guys
| >sound raspy and muffled. they may have there box on a peak meter thinking
| they
| >have all kinds of swing when in reality on a rms meter there backswinging
| and
| >sounding like shit.

#1Run a wire from the large post (+) on the alternator to the (pos) screw on the regulator

#2Run a wire from (F) on the alternator to (FLD) on the regulator.

#3Run a wire from a good ground on the vehicle to (NEG) or (GND) on the regulator.

You might prefer to run positive wire (#1) to the battery bank instead of to the alternator, for safety sake don't forget fuse's

Could only find an 80A model?

Found another SMPS Co @

http://www.duracomm.com

that DO advertise a 100A unit!

Just heard of a company called 'Luke' but my multiple search engine
found a big zero.

Does anyone on the ng have a copy of 'Yagi Max' or similar software to hand?

I have EZNEC but would like to see what figures other people come up with.

The project:

To optimise a Hy-Gain/Telrex 5-element Long John horizontally polarised yagi antenna mounted one wavelength above ground for maximum forward gain on 27.025.

Front to back and side rejection is not important.

The factory quotes a forward gain over a dipole of 12.7db but this was in the days before anyone modelled on computers and taking into consideration f/b and rear rejection.

The boom length is 24ft for those not familiar with this antenna.

I want the antenna optimised for 27.025.

The beer's on me for the first person with some element length and spacing numbers.

Thanks

Phil

I agree, the mo batteries, the more current draw on the alternator required when "charging". Now if the guy runs his regulator at the exact same voltage his batteries are at "cold" then it doesn't really matter, But everyone knows that this is not the proper way to do things and each battery should be considered as another "load" on the alternator. I am sure this will be disagreed by a few, but that is the way I do things.

Boo I like to think the Amps are a load on the batteries. The alternators are just there to keep filling the batteries. It is the same concept with capacitors they are often used to be a voltage bank so the load doesn't draw from the main source in this case the alternators.

This is just my theory It sounds god to me.

The right price to anything is:
1.) The price you are willing to pay for something.
2.) Not a price higher then the average going price of the same item in the
same condition.
3.) Lower on used Items as in reference to the same item brand new.

VOLTAGE IS A POTENTIAL DIFFERENCE;
water and electricity act the same way...

Let me give you a simple example. When you go to get a drink of water are you draining from the river or the water companies supply?

The river is the alternator.
The water companies supply is the battery or capacitor bank.
The amplifier is just taking a cup of water.

You guys think to hard. Break your problems down to simple concepts and they will appear much simpler to understand.

It is obvious that if the river isn't big enough for the water company to supply the whole town you will see some voltage drops. You are not going to dig a bigger river you will build a bigger water company supply bank right????

This is the same case as an alternator and battery system!!

When I first came out to the NG I felt really stupid. No seriously, I thought you guys where Rf experts and knew everything. The longer I hang around this place the dumber you guys seem to me. You guys are twisting facts making up shit that makes no sense and all kind of shit.

YES IT IS TRUE THAT:    I'm not an Rf expert, I don't know everything there is to know, and I do make mistakes. But even when I'm wrong I am making educated attempts. You guys just blurt out shit when you have no Idea what you are talking about.

Well you f*ck off.... Let me tell you... Firstly, the best of you ran down
your postal clerks leg.... Perhaps you should learn how to "hack" TIM!
Nice try..... Have a good day...

I would say you are speaking about when you have higher negative peaks than

positive.. This in turn creates modulation "cut-off", which is backswing...
this is what will cause harmonics, distortion, etc, etc.... Right?  Is this
what you meant?

Mr. 137 wrote in message ...
|I'd call it simple backswing, reflect watts resulting in burned radio and
|box.
|
|But correct me if I'm wrong.  Has anyone heard of the "see-saw" effect?
The
|more the swing, the less the modulation?  The lesser the swing, the more
the
|modulation?  Or have I been out of the loop (or totally out of it for the
|past 8 years) and should be told to go sit in the corner now?
|

I would like to see how long that "8 pill" will last.......When you wire
"a bunch of batteries" in parallel.  In case you didn't know, voltage
increases when you do this.
(you CAN'T run an amp at 24v+ for very long, and it gets pretty
expensive replacing transistors!!)
          .....Run your Driver on the vehicles electrical system
(13.5~13.8v) Run a 100a alternator, in the stock position~with the
biggest battery that wll fit under the hood.
Next, run a Leece/Neville 130a alternator
(custom-mounted), with an external voltage regulator.(adjustable
12~24v).
I don't know what your setup is, or what kind of vehicle you
have......Just make sure you're running at least 2ga. power cable, with
a good ground......And MAKE SURE everything is fused!!
                                        .......Maniac

There was confusion I believe on my part... seeing that you two like to have or display similar AOL usernames.....    I noted my error that one is xeroeightytwo and the other is zeroeightytwo @aol.com

If that is the case... Then I f*cked up.... and then let me re-post my post...

prozac 625 wrote in message ...
|I think you are getting confused here.
|All the messages and this one here are by the real Prozac 625 only one
|message way by some one else. So I don't get what you are saying.

I dont believe I would be so conceited to say I was a RF expert myself...
however, I -DO- know I make mostly educated and EXPERIENCED
comments.......replies.....etc..

So, to this, I believe you are in error when you say "the dumber you guys
seem to me." Or at least I am said to say that you have not really matured
then my friend.... With maturity you will realize how much you have to
learn, rather than how much you think you know of electronics in general....
Now, if you were in error (from a quick post, whatever) and accidentally
wrote "you guys," which is comparable to SOMEONE saying "all CBer's run
illegally" then okay.... clean slate.... other wise, this post and the above
statement of mine remains....

prozac 625 wrote in message ...
|When I first came out to the NG I felt really stupid. No seriously, I
|thought you guys where Rf experts and knew everything. The longer I hang
|around this place the dumber you guys seem to me. You guys are twisting
|facts making up shit that makes no sense and all kind of shit.
|
|YES IT IS TRUE THAT: I'm not an Rf expert, I don't know everything there
|is to know, and I do make mistakes. But even when I'm wrong I am making

```
|educated attempts. You guys just blurt out shit when you have no Idea what
|you are talking about.

Maniac you stupid jerk, wiring batteries in parallel increases current capability not the voltage, wiring them in series increases the voltage. In case you didnt know.

I know this is short notice but I would like to try to put together a
NET on lower side band channel 36 for DEC 31 throught Jan 1.  The net
work start at 23:00 Washington DC time and run through 02:00 California
Time.  I am in new orleans my number is HA488 (Hotel Alpha 488).  If you

are interested let me know, I would like to see if we can put together
```

```
the 1st CB radio Relay thats nation wide!.

Thanks
Joe
BTW also e-mail responces to me so that I can have a better way to track

them.

That Frequency is also used by the WMC sideband club. They are at:

http://members.xoom.net/wmc_club
Send them an email and maybe they can bring it up on their net
Tuesday evening.

Has anyone had any problem with Exports R Us lately ? I have sent some stuff in to be repaired and turned up and it has been at least two months. I have been getting the same run around , yeah it will go out this week. Well needless to say, NOTTA.
Well I guess, maybe Santa will bring it to me on his sleigh.
Their sales and service used to be good and fast , are they slipping ?

The reason said I did not understand was because I can run say an 8 pill
box @ 19 volts, keying 2500 and swinging down on a bird 43 and my reflect
is only a couple of watts @ the antennas. The input reflect on the amps is
real low as well. See this is why I said I did not understand.

Picked up one of these , a while back,export model,in and out of a couple local shops , oops the 477 finals been changed ,to a wimpy one , kept sounding like crap on sideband, not sure what they put in , more of a 5 watt thing,could have bought a new radio for what I've got in this one , seems to work ok now , takes about 10 minutes to warm up for sideband stabilization, spose its worth putting a stronger final back in if I'm going to keep it or were these just a pile of crap radio ???? its one of the older models ,

Do some testing and see if more batteries are better, break out your dc current transformer and take a current reading on the wires feeding the batteries from the alternators, then take a reading between the amp and the batteries you will see a little more current draw between the alts and batteries, even if you are charging .5 volts above battery voltage, now increase the voltage to say 2 volts above the batteries and see how much the current draw increases at the alts over what it is at the amps, also note that there is still a load on the alternators even after you unkey, the more batteries you add the more current draw on the alternators. Now if you do not have enough alternator and are pulling down to battery voltage then you will see the voltage drop less with more batteries, But it will only wear your alternator out sooner by adding more batteries unless you charge right at battery voltage. If your alternator is just barely big enough to handle the job and it works fine with say one battery and you go in there and add 6 more batteries you will see less watts, now all of this is assuming the system is "truly" wired with enough conductor on both positive and negative sides of the system from the alternator to the amp.

Now this my "simple example" and it has a very "simple concept" its called time tested truth, and not to be a knowitall but I will stand behind this one until the end.

Hello RWhite3767: Get a hold of your self man, the Starduster is a less than preminum antenna. I wouldn't melt down the aluminum from a Starduster for my beer cans.

Great Antennas are in order of greatnest:
1 Penetrator 500
2 MaCo V5/8 & Avanti Sigma 5/8
3 CLR-2
4 Antler
5 Window mount mobile antenna
6 Starduster

Jay in the Mojave

Now why would that be?  I mean, why would you want to key so high and swing down?  I'm just curious because wouldn't the modulation of your audio be "choppy" or to the point of almost broken up?  Out here in the Mohave, I've seen some readings back swing from the Mag, Smokey Hills and other places and the audio is real crappy.  Why?

Besides, I believe and know that a properly tuned antenna system will cause low reflect to the amps.  But why would you want to key that high and swing down?  Makes no sense...

Power = amps  times  voltage
You have to specify the voltage. Probably 12V.
50/12 =
300/12=

This mic friggin' sux!!!  Why would anyone want to by a mic that makes their audio so "tinny"?  Get a 575M6 or go back to stock.  What a waste of money.

Just a couple of pennies...

137... back out!

Tim! You win the grand prize! Headroom is the key no matter what meter you are using. The device(s) can only do so much. Exact tuning or swing kits(!?) alter the ratio of carrier to forward modulation or swing in a given amount of "headroom". I rarely run my radios higher than 25% of the peak output. Why make the radios do all the work when those things behind you have heatsinks? If you need more watts add a stage. If that is not possible then add a driver.

--
This is CB radio..........No crying allowed!

Miles Davis

Could those of you who use a CB/AM/FM antenna let me know what your
experience has been?  Which antenna you use? Which splitter? How the
performance compares to a standard like the Wilson 1000?

Thanks a lot for your help.

Pat

In article <385DB227.A8242CB5@jejr.com>, kjfdskdj@jejr.com says...
>Power = amps  times  voltage
>You have to specify the voltage. Probably 12V.
>50/12 =
>300/12=

 Okay, so I can run a 50 watt amp off of
 6 amps or not? I can't seem to get a
 straight answer on this. Does anyone
 know? You're saying that I can run
 a 70 watt linear off of a 5 amp
 linear?  50Watt / 12Vlt = 4 (approximately)
 It still doesn't sound right. let
 me re phrase the question: If YOU were
 running an old 50 watt linear and you
 wanted an AC to DC converter to run
 it (amp only), how many amps would you
 need to use? A lot of you guys seem
 purdy knowledgeable about this but
 no one seems to be able to answer
 a simple question!!!!

 I guess I should just forget about it!

Yes, it actually is that easy...
I don't know which newsreader you use, but there should be a selection
under preferences or options that will allow you to filter or ignore
posts and/or email from certain parties. Just enter the email address
or screen name that you want to ignore, and you will no longer see
their posts. A lot of the newsreaders will replace their post with a
<plonk!> Of course, if they change their name (or email address) you
will see their posts again - however, a quick update to the "ignore"
list will remedy the situation ;-)

That depends upon whether it is Imperial Watts or American Watts.

I like the Starduster. There's a new one made by Sirio - but I don't
know how it compares to the old.
For gain though, I think you'll find that a 5/8ths is going to give
better performance.

MC

Comparing electrical current to water current works for the rudimentary stuff, but introduce a semi-conductor and the theory falls to pieces.

I have two questions for you before I decide on which antenna to buy
.
#1 -  is the I-MAX 2000 adjustable for swr's?  if so how is it tuned ,
and
 is the MACO V-5000  adjustable for swr's?    if so how is it tuned
 #2-    Also, In your opinion , which is the better antenna for the 11
meter band?
It will be mounted on the roof and be hooked to a GALAXY SATURN base
station.

Thank you for your time,
Rafterman

I don't want to butcher it...  There are mods out there that make this
an even better sounding mic...  One website wants $5.00 and he will
email the instructions to me...  I am not going to send some guy $5
and possibly find out he is a farce...  That is why I am asking the
world...

Depends on what is supposed to be here being repaired.  We are caught up and
everything is on schedual in repairs and orders.  We may need to check a
tracking number out.  We go around the clock the majority of the time.

Set the switch to the calibrate position.  Key up the microphone with no
modulation and adjust the knob until the needle is on the calibrate mark, then
relese the microphone and position the switch to swr and key the microphone and
look at the reading.  If it is higher on 40 then shorten the antenna, if it is
higher on 1 lengthen the antenna.

Let me try to make sense out of this. Hank Aaron I did get impersonated by
some one. But I now see why you think Tim is me or I am Tim. Let me explain:

Every time Tim posted to the NG I got a Carbon copy sent to me. I replaced my Email address with his so now he is forced to spam himself!!!

By the way Dirk Diggler, PROZAC 625, And D.M. cheer leader are all the same person (ME!)

Boo is right.  The alternator system needs to be able to supply ALL of the current with no sag at any time.  The batteries are simply buffers that CAN bog down the system IF the alternators can't keep up with the demand.  After all, even after you turn off the faucet, the river still has to fill the storage tank that you just depleted.

More alternator with less battery equals lower maintenance, less chance for boiling over or explosions, damage to one's self or the vehicle from fumes, less weight and wear and tear on the motor / trans, better gas mileage, etc...  The alternators only produce as much power as needed on demand.
Sean
>

-=PEAKABOO=- wrote in message <83k29s$q91$1@nntp8.atl.mindspring.net>...
Do some testing and see if more batteries are better, break out your dc current transformer and take a current reading on the wires feeding the batteries from the alternators, then take a reading between the amp and the batteries you will see a little more current draw between the alts and batteries, even if you are charging .5 volts above battery voltage, now increase the voltage to say 2 volts above the batteries and see how much the current draw increases at the alts over what it is at the amps, also note that there is still a load on the alternators even after you unkey, the more batteries you add the more current draw on the alternators. Now if you do not have enough alternator and are pulling down to battery voltage then you will see the voltage drop less with more batteries, But it will only wear your alternator out sooner by adding more batteries unless you charge right at battery voltage. If your alternator is just barely big enough to handle the job and it works fine with say one battery and you go in there and add 6 more batteries you will see less watts, now all of this is assuming the system is "truly" wired with enough conductor on both positive and negative sides of the system from the alternator to the amp.

Now this my "simple example" and it has a very "simple concept" its called
time tested truth, and not to be a knowitall but I will stand behind this
one until the end.

          -=PEAKABOO=-

That is a single stud mounted final and can pull as much as 10 - 12 amps or
so.  It should do measurably more than 50 watts peak if it's in good shape.

I'm gonna' fire up the crowd and say that I think the Firestik KW-7
is the best antenna for the money. I have talked anywhere I wanted

to. Coast to coast with a two pill. I always keyed on my buddy who
had a 7 foot Skipshooter. They looked identical, but they don't act
identical. And the Firestik costs less last time I checked.

Since the average power remains the same in all circumstances, i'll take the
easy way out.  Whoever has the best antenna system wins  :  )

Actually, the guy with the biggest peak would be the loudest.  Since
waveforms from radio to radio differ so much, it is impossible to tell given
this example.  Sean
>

DriveByShooter > wrote in message ...
Sean that was the point in all of the examples the avg power was 500 watts,
they all just had a different deadkey. Which would you assume would be the
louder of all 3 situations? Since MC ducked answering it.

prozac 625 wrote in message ...
When I first came out to the NG I felt really stupid. No seriously, I thought you guys where Rf experts and knew everything. The longer I hang around this place the dumber you guys seem to me. You guys are twisting facts making up shit that makes no sense and all kind of shit.

YES IT IS TRUE THAT: I'm not an Rf expert, I don't know everything there is to know, and I do make mistakes. But even when I'm wrong I am making educated attempts. You guys just blurt out shit when you have no Idea what you are talking about.

What you think of idea of realization of radioexpedition on Southern Altai?

Southern Altai - highland is on the board of Kazakhstan, Russia, China and Mongoly.
Land of lakes and waterfalls, mountain taiga and stormy rivers, deserts and snowy peaks...
In time of Soviet Union this territory had been absolutelly inaccessible for foreign tourists (and furthermore for radioexpedition) - in locale
It is not enough of ham stations.

The base camp of expedition is planned to place in region by highest Fastigiums of Siberia and Altai of a mountain Belooha, lake Markakol and Zaisan.

If you were interested by our proposal, we can be found on ranges 21Mhz, 28Mhz call sign UN8JZZ (collective radio station)

Subject: What SSB radio to buy - <$150?

I've decided to take the plunge and get a SSB radio. I was ready to order one of the reconditioned units (Grant XL - $132)) from the Uniden web site and then decided to do a little web surfing. Now I see that there is a Grant LT and at least one Cobra model that fits my price range. Any recommendations to a newby as to what to buy and where to buy it? This is my first CB besides one of the GE emergency units and I'd rather spend the money now than to have to upgrade from a pure AM unit later.

Allen

I am just a Navy NUCOFF, what do I know....... <g>

Dirk Diggler wrote in message ...
|I am going to use velocity to prove a point since it is much easier than Rf
|AM modulation. Please note the concept is the same~
|
|(A)-----------------------(B)
|
|Point T1, X1 = (0 Sec,0 Ft )
|Point T2, X2 = (10 Sec, 10Ft)
|
|Average velocity = Delta X / Delta T (right?)
|

```
|now if you go from point A to point B and back to point A what is your
|average Velocity?
|
|Answer: 10Ft - 0Ft / 10 Sec - 0 Sec = 0 Ft/Sec
|
|Are you telling be he didn't move?
|
|Average is not very reliable.
|You need to know calculus to find the Instantaneous values of Velocity.
|
|That is where my $60,000 education came in to play!

I'll take credit of TRYING to point that very fact out awhile ago....

Watch out Sean, dont want to get accused of "dick riding".... <g>

Sean wrote in message ...
|Boo is right.  The alternator system needs to be able to supply ALL of the
|current with no sag at any time.  The batteries are simply buffers that CAN
|bog down the system IF the alternators can't keep up with the demand.
```

After
|all, even after you turn off the faucet, the river still has to fill the
|storage tank that you just depleted.
|
|More alternator with less battery equals lower maintenance, less chance for
|boiling over or explosions, damage to one's self or the vehicle from fumes,
|less weight and wear and tear on the motor / trans, better gas mileage,
|etc...  The alternators only produce as much power as needed on demand.
|Sean
|>
|
|-=PEAKABOO=- wrote in message <83k29s$q91$1@nntp8.atl.mindspring.net>...
|Do some testing and see if more batteries are better, break out your dc
|current transformer and take a current reading on the wires feeding the
|batteries from the alternators, then take a reading between the amp and
|the batteries you will see a little more current draw between the alts and
|batteries, even if you are charging .5 volts above battery voltage, now
|increase the voltage to say 2 volts above the batteries and see how much
|the current draw increases at the alts over what it is at the amps, also
|note that there is still a load on the alternators even after you unkey,
|the more batteries you add the more current draw on the alternators. Now
|if you do not have enough alternator and are pulling down to battery
|voltage then you will see the voltage drop less with more batteries, But
|it will only wear your alternator out sooner by adding more batteries
|unless you charge right at battery voltage. If your alternator is just
|barely big enough to handle the job and it works fine with say one battery
|and you go in there and add 6 more batteries you will see less watts, now
|all of this is assuming the system is "truly" wired with enough conductor
|on both positive and negative sides of the system from the alternator to
|the amp.
|
|Now this my "simple example" and it has a very "simple concept" its called
|time tested truth, and not to be a knowitall but I will stand behind this
|one until the end.
|

Well, I would like to bullshit everyone, so that I get some kind of response... but here goes:

Who feels that "matching" of RF Transistors (as performed by say, RF Parts) is unnecessary? Who feels it is necessary?  Why do you say it is either unnecessary or necessary?

I have my own opinions.... See if another interesting thread can be started....

the d104m6b mods that he is talking about is to make the audio less
"tinny"...it has nothing to do with the power of the microphone,any more power
out of that mic is nothing but trouble,but especially on SSB the audio sounds
to "tinny" and flat....that is what the mods are for.73's

> not sure if I want to butcher this thing up or leave it "stock"

Do you know what would be involved in order to "high level" modulate a 100 watt rig, like the Kenwood?

Assuming that you didn't mind all the external wires and connections (as there is probably no extra room inside the radio), you would have to fabricate a modulator capable of at least 50 watts of audio power, you would have to add a modulation transformer to the final B+ line, and attach the mike level, high level output, and power leads.

I'd leave it stock.....

For a ground to be effective at RF frequencies, it has to be a short as possible with as much surface area as possible. A flat "strap" is better than a round wire. If you can bolt the cases of the radio and amp directly to the body of the car (Which is tough in today's vehicles), so much the better.

The reason that I mentioned the long wire as how NOT to ground, is that a sufficient length of wire starts to look like an antenna to RF, and will make the problem worse. Think "short and flat" as opposed to "long and round".

Believe it or not, I've run a Texas star 5 pill through a mag mount antenna before and never did anything to the paint. I did eventually fry the antenna though (a K40). I was very lucky that I didn't have squeal problems. I did have problems with the RF getting into the vehicle electronics and causing problems. When I went to the body mount whip, this all went away.

Most times, the white under a magnet mount antenna, is due to
trapped moisture.

Sometimes you just have to be smarter, not faster.

A farmer goes out and buys a brand new stud rooster for his chicken coop. So the new rooster struts over to the old rooster and says, "OK, old fart, time to retire."

The old rooster replies, "Come on, you can't handle ALL these chickens, look what it's done to me. Can't you just let me have the two old hens over in the corner?"

The young rooster says, "Scram! Beat it! You're washed up and I'm taking over."

The old rooster says, "I'll tell you what, young stud, I'll race you around the farmhouse. Whoever wins gets exclusive domain over the entire chicken coop."

The young rooster laughs, "You know you don't stand a chance old man, so just to be fair, I'll give you a head start."

So, they get a chicken to cluck "Go!", and the old rooster takes off running. About fifteen seconds later, the young rooster takes off after him. They round the front of the farmhouse and the young rooster has closed the gap. He's already about five inches behind the old rooster and gaining fast.

The farmer, meanwhile, is sitting on the front porch when he sees the roosters running by. He grabs up his shotgun and BOOM!, he blows the young rooster to bits.

The farmer sadly shakes his head, "Damn it, ...third gay rooster I bought this month."

i was just wondering what the group feels is the best method(s) to obtaining the best audio quality,now i dont mean loudness and echo...i mean downright quality audio...do you guys prefer modified radio's with stock mic?power mics?mic pre-amps??or what,what do you guys run,and what reports do you get?basically what im trying to say is,what do you feel is the most important approach to quality audio...whether it be am,ssb, or even fm?????

ps-once again..any idiot can make there audio LOUD....im talking about all around performance and quality,,,73's

Scott, power divided by voltage is only part of the equation. You also have to factor in the efficiency of the amplifier. No amp is 100% efficient. Also will 50 watts be the peak output? Or the average? Most power supplies list their peak output not continuous output. I would recommend a power supply in the 8 to 10 amp range.

See this argument is weak.... For one, all truck drivers are not "inconsiderate and stupid".... Secondly, why should ANYONE move to another channel simply because they are asked to? That depends on who was there first I suppose....

Maniac wrote in message
<9176-385D78EA-21@storefull-163.iap.bryant.webtv.net>...
That would be great(to set aside channels), but you know as well as I do....
There will ALWAYS be stupid, inconciderate, out-of-state truck drivers, that will not go to another frequency when asked politely....I'll side with Miles, and go with a mudduck(under 500w) filter....
....Maniac

It all starts at the Microphone.  I prefer high quality studio microphones (electret-condenser types, NOT dynamic types). I don't think there is any need for any more pre-amp between the mic and the radio. Usually, these types of mics put out enough to drive the radio.  Besides, another level of pre-amp introduces more distortion in audio.

Next step, the radio should be a good quality radio...(read HAM radio). Not these cheap, Taiwan garbage radios (Rangers). Kenwood, Yaesu or Icom (or Collins or  Drake for some good sounding AM).  Next, make sure the audio-passband is nice and wide. Usaually, this just requires changing some capacitor(s) in the mic-audio preamp stage in the radio.

Next, add a little  RF (not AF) compression to the mix, if your radio can do so.  Finally, if you are going to use an amp (I am talking 1KW or over) - please, use a good old tube amp.

Run everthing nice and normal, don't overdrive things (mic, amps) - it causes distortion, and your audio will be great.

If you insist on using that D-104 mic with the Crystal element, please,
build a simple circuit to step down that high impedance mic to match
the 600 ohm impedance of your modern radio. You will no longer
need that preamp  and your audio will be so much more fuller.

Later,

The Ghost of Bob.

Tim,

We carry two types of glass related antennas. The first one is the glass mount antenna that you mount by sticking the antenna to the window. The coax is then stuck to the other side of the glass and that is then routed to your radio. This one is made by Antenna Specialist. It is model M-906. It is a cellular look alike and we retail it for $29.99.

The second is made of three parts. a)the Cherokee SA-4 antenna. It is 30.5" long has a male BNC connector and is $14.99. b) the Workman WMWC-1 antenna mount that is set on the top of your roll up window glass, it is locked in place when the window is rolled all the way up. This mount has a outside female BNC connector and on the inside a 8' RG-174U coaxial cable with a male BNC connector. We retail this mount for $9.99. c) the Workman 40-2620 female BNC to male UHF. We retail this connector for $2.19. Antenna to mount to connector to radio total cost $27.17.

We wholesale and retail the above items.

If you buy something from CASH MONEY he will make the deal, tell you how
```

```
it will be shipped to you then turn around and sell it to someone else
and leave you hanging without even having the courtesy to tell you about
it until you e mail him 3 or 4 times asking about the total cost on the
shipping and all. Thats how he did me on a small deal on that Cherokee
radio he had for sale.

> know? You're saying that I can run
> a 70 watt linear off of a 5 amp
> linear?  50Watt / 12Vlt = 4 (approximately)
> It still doesn't sound right.

Snip

It doesn't sound right because it isn't.
Most radios run around 50% efficient.
Some linears run at as much as 70%
efficiency. I take it you are talking
about a 50 average watt linear, not
a 50 watt average radio.

If that's the case then: 50/12 = 4, but
then you must factor in the inefficiency.
So:

4 x the inverse of 70%, or 4 x 1.42857
= 5.7 amps.

This 5.7 amp figure is with a highly
efficient amp. If your amp is only 50%
efficient then you will need an 8 amp
supply. Furthermore a six amp supply can
run a 66%  efficient 50 watt amp at 12
volts.

p.s. most cb linears run around 66%

: Who feels that "matching" of RF Transistors (as performed by say, RF Parts)
: is unnecessary? Who feels it is necessary?  Why do you say it is either
: unnecessary or necessary?

Because bi-polar transistors near their limits will heat up and draw more current.  If you have proper bias current tracking in your amplfier, the circuit will properly control the transistors evenly. Unmatched transistors will not share current and your in for big trouble. The replacement costs are much more than the extra matched pair fees.

cheers
skipp

Hank if you are going to DC ground the base through the xfmr and drive the piss out of them, I do not think it matters at all. In some cases running positive voltage on the base of the transistor would require matching but very seldom have I seen a need for this unless you are replacing just one of the transistors.

Hi Bob
I would be interested in info on matching up the D-104 too a 600 ohm radio.If
you could inform me or direct me I would be greatful.I know there are better
mics, but I just like the D-104.Also, doyou know of any way to improve this mic
for SSB?

Thanks for your time and any help.
Rob

>
> Who is correct and why?

Cutting the modulation limiter on a radio disables the AMC/ALC.  This allows more audio as the modulation is not "limited" to the stock figure of around 80% (depending on the radio.. Some are only 50% others up to 90%.)  Cutting the limiter
is an easy way to boost the modulation and peak power on most CB radios.  Take the Cherokee CBS 1000 base for example.. Even when the AMC/ALC is cranked the limiter pulls back hard and clamps the audio.  You can really hear this on the air if you know what to listen for. On that radio you really need to either cut the limiter or
add a resistor to one leg to raise the point of which the limiter clamps.  Of course you could also swap in a different transistor but you will get the same effect if you just add a resistor.  That is one of the few radios that I usually

end up removing the limiter all together.  Allot of older radios perform worse if the limiter is just removed.  Some will severally over modulate even with the stock mic after the limiter is cut.  So... On certain radios for certain people I cut the limiter out.  Most of the time I tune them correctly so the circuit is still working but just on the edge. This keeps the radio clean but it will still have good audio output.  I never remove the limiter unless I absolutely have to or it is requested.  Even then I will try to pad the transistors effectiveness first.  As far as Techs saying to run as fast as you can if you catch a tech snipping a limiter goes its not really that simple.  If a guy requests it I will do it. What they are implying is that anybody who just opens any radio and cuts the limiter must not know what they are doing.  This is a bunch of crap. I don't know everything by any means but I can look at a scope and watch modulation.. If the radio performs better and still remains somewhat clean with the limiter out I say cut it....

MC

Cool.  That 4 pill was working good.  I had a whole room full of you down here in AZ.  Maybe we will hook up again some time.  I am going to start talking more skip and ease of the local talking for a while..

See ya on the Bowl...

It was an example, on a peak meter it is not swinging down. It could be me
but I think the big carrier works better in that heavy duty DX, if I did
not tell you I was keying high, your ears would not tell you. the audio is
crystal clear when doing this.

This is a tricky one. What I like you might hate. But for me it is an older Tube radio with a D104 mic. Each radio has a distinct sound. Time and time again people tell me that my Johnson 223 or my black face johnson with a D104 is the best clearest station they have ever heard. I don't over drive it. Just enough to make it talk but clean.. Its real hard to beat a Johnson on the audio clarity. Match that up to a modulator as a driver and you have one clean sounding but still loud station. One guys setup came to mind as I was typing this out. A FT 101EE with a D104 that a local has is an incredible combo. I am talking about the older D104's. The old lollipop or Chicken Choker that was hand wired. I liked it so much I picked up a 101ee and used the same mic. 101's really sound nice on AM if they are run right. I cant stand the sound of some of the newer radios when people use power mics to overdrive them. The point of CB is to communicate and if you cant hear someone clearly what's the point? Don't get me wrong. I like to get out there at times and run some serious audio. But most of the time I run it down and would hope it sounds good (I have never heard my station. Hey Toll, That's what we forgot to do.).

I am a sucker for Plate modulation and a old D104....

The only thing all this swing accomplishes is it makes the transmit
output meter and receiver s meters swing wildly with modulation which
makes everyone think they must be putting out a really big signal
because the meters are swinging. Other than that, it accomplishes
nothing.

The sound part is not always true, maybe on the amps you guys run. I bet
if prozac takes his 32 and keys high and swings down 500 watts on a bird
he will still sound crystal clear. I am not Prozac Cheerleader I just know
his amp should be of quality

|
|The only thing all this swing accomplishes is it makes the transmit
|output meter and receiver s meters swing wildly with modulation which
|makes everyone think they must be putting out a really big signal
|because the meters are swinging. Other than that, it accomplishes
|nothing.

No..  I would run a 10 amp supply.
```

You can also count the number of transistors in the thing....

If it has 2290s or 2879s, then you need about 20 amps per transistor at 15 volts.

If it has 455s or others, then 10 to 15 would be plenty.

Toll Free

```

O.K., if you really want to know..

To figure out the collector to ground impedance of a base driven, common emmiter transistor, you take the following formula...

(Vcc*Vcc)/2Pout.

This is per transistor.. Therefore, if you are seeing (on average) 100 watts per transistor (IE, a 4 pill doing 400 watts) at 13.8 volts, you would have....

13.8*13.8=190.44

100 * 2=200

Therefore, the true collector load for each transistor is 190.4/200, or .9522 ohms.

Now, plug this number into the standard Ohms law equations, and what do you get?

Watts / R = Isquared

100 / .9522=105

Now, take the square root of 105, and you get 10.25 (or right about their.).

Multiply that by 1.3 (which would give you the appropriate formula for getting to the correct 70 percent efficiency (this is a supposed designed for number) to get the correct efficiency and you get...

13.325 amps.

Multiply that number (the current) by supply voltage and you get what...

183 watts of input... Which would be right along with what you need for 100 watts of input.

Their... Guess your education was wasted, eh????

And here is your last comment, just to be on the safe side...

Toll Free

THE REASON YOU GUYS CANT FIND THE CURRENT IS BECAUSE YOU ARE USING THE WRONG LOAD RESISTANCE!! You are using 50 Ohm that is your load at the antenna do you care how much current is at the antenna?? I don't care. My point is you can only find Current in side the circuitry on single resistances not A general overall resistance!!!

Unless you can tell me the resistance of the amplifier. Put a multi meter across the Power cables of an amp and tell me what you get!!!!

If your meter reads 50 Ohms call me an asshole.
If it doesn't now you know why I paid for my education!!

That is, collector voltage squared divided by twice the power out.

I am assuming you are using a bird 43 for this test..

Choice A is a 200 watt carrier and a 500 RMS on audio..  500 watts RMS is 1414 peak watts.  1400 peak watts with a 200 watt carrier is over modulation..

>
> 2.) Choice "B" has 0%.

Actually Choice "B" has more than 0%.  That would mean a 500 watt carrier with 1400 peak watts.  That's around 1/3 of the peak.

>
> 3.) choice "C" is keying up with 800 watts and dropping down to 500 Not
> good!!
>

That's really 800 watts with a peak of 1400.   I would still run choice "A" or choice "B".  I bet choice "A" would win in a contest as he would be the loudest..

Just in case you did not know how to figure peak power from an RMS figure on a bird here is how:

Of course this does not apply to an AM carrier... Only a modulated signal.

Take the modulated RMS figure and times it by 2.828 times to get peak..  That 500 watt RMS figure from choice "B" was really over 1400 peak watts.  As you can see it is not tight..   To prove this I did a test at home with my new Bird43 peak meter and a SB 220.  On modulation my SB 220 was showing 700 RMS bird.  I flipped the peak switch on and the meter read right between 1900-2000 watts holding (2.5kw slug).  Do the math: 700 X 2.828 times is =1979 peak watts.  It was exactly on.

MC Turner.. ( I guess I will start using my full name "MC Turner" again as I see there is another MC on the group now. I would not want to get confused with him and I am sure he would not want to get confused with me :)  Things have changed in the last 4 years on this group..

have a nice emperor 5010 10/11 meter mobile 26.000mhz-30.000mhz
all mode excellent condition,clarifier has been tied,
comes with a white tornado 200 watt amp........$250.00 shipped
thanks jack

This place reminds me of the old saying too many chiefs and not enough Indians.

Every one go the answer yet the problems still exist.

I have said that in two separate posts today.. People miss that fact that he stated RMS power. Holding steady on RMS meter and not dipping or pulling back is not going to sound tight... you know it I know it..

Peak is RMS * .707 or about 70% more then the RMS.
RMS is peak / .707 or about 70% of the Peak
What do you need a meter for?

| Just in case you did not know how to figure peak power from an RMS figure
on a
| bird here is how:
|
| Of course this does not apply to an AM carrier... Only a modulated signal.
|
| Take the modulated RMS figure and times it by 2.828 times to get peak..
That
| 500 watt RMS figure from choice "B" was really over 1400 peak watts.  As
you can
| see it is not tight..   To prove this I did a test at home with my new
Bird43
| peak meter and a SB 220.  On modulation my SB 220 was showing 700 RMS
bird.  I
| flipped the peak switch on and the meter read right between 1900-2000
watts
| holding (2.5kw slug).  Do the math: 700 X 2.828 times is =1979 peak watts.
It
| was exactly on.
|
| MC Turner.. ( I guess I will start using my full name "MC Turner" again as
I see

| there is another MC on the group now. I would not want to get confused
with him
| and I am sure he would not want to get confused with me :)  Things have
changed
| in the last 4 years on this group..
|
|
|

EXPORTS-R-US SUCK!!!

I bought a radio from them and pre-paid, but never recieved it. When I called them back, they said"OH, it's on order and we're out of stock"

Funny how you didn't say that when I was giving you my credit card # !!!
What a bunch of morons.

Called Express Electronics (Exportradios.com) and got it withing 4 days tweeked n' peaked!!!

Now my credit card company is going to get involved with them since they won't give my money back.

What a bunch of assholes.

Newsline 1166

Newsline report number 1166 with a release date of Friday, December 17th 1999 to
follow in

5-4-3-2-1.

The following is a Q-S-T.  Six meters opens with the best winter D-X conditions in
forty years, the A-R-R-L says it
will appeal further to expand P-R-B one and will cellular phones soon replace ham
radio as the best way to get
help?  All this and more on Newsline report number 1166 coming your way right now!

(Billboard Cart Here)

**

It was 1959 all over again in 1999 as six meters gave hams world-wide a pre-

Christmas opening reminiscent of one that occurred forty years ago. For hams in the United States, Saturday, December 11th brought a coast to coast opening that was armchair copy. Take a listen:

-----
Daves DX audio Here
-----

That was Newslines neighbor Dave Booth, KC6WFS making a contact with K3UM in Williamsport Pennsylvania while running only about one watt out of an M-F-J six meter SSB transceiver. In simpler terms, that QSO amounts to about 2450 miles per watt! And that was not the only DX that Dave Booth heard or worked. Take a listen:

-----
Daves DX Audio Here
-----

But KC6WFS was not the only stateside ham to report amazing 6 meter DX conditions. Dave Bernhardt, N7DB, in Boring Oregon tells over the VHF Reflector of his unexpected mid-winter DX. Dave says that he began working stations at about 17:40 UTC. The first station that Dave contacted was Bruce Sternstein., K2RTH in Miami followed by Austin Regal N4WW in Apopka Florida. He then began hearing stations further North and worked Dennis Lansa AA3ID in Frisco North Carolina, Mario Rotundo K2MUB in Swan Lake New York and Elbert Gross, K2SPO in Rochester.

For stations in the Mountain states to the East Coast an opening on Sunday December 12th provided an almost repeater quality path up to Alaska. Brian Allen, N0VSB in Elizabeth Colorado was one of the first to hear about a half a dozen Alaskan stations including KL7NO. He says KL7NO was 59 plus 20 DB for almost an hour.

Moving East, Dave Calvert,KB0PE, in Saint Louis Missouri reports working Alaskan stations KL7NO, KL7FZ and NL7Z before -- as he puts it -- somebody stole the whole 6 meter band. Dave's contacts took place between 21:40 and 21:57 U-T-C just before 6 meters went to sleep.

But KB0PE was not alone. Even further to the east in Pasadena Maryland, Fred Heath, N3XBG says that he was able to work NL7Z on 50.135 on only his second try. Fred also reports hearing KL7FZ but says that he was generating a huge pile-up on 50.125 MHz.

The openings continued into Monday December 13th with reports that Ron Jay, WH6O at Ewa Beach Hawaii was heard working stations in California, Mexico, New Mexico and Alabama.  Reports from overseas like that of New Zealand's Mike Foubister, ZL3TIC who worked numerous Western United States and Mexico satations also says a lot.  It says that this is one of the best surprise six meter winter DX seasons ever recorded.  (Newsline)

**

## ARRL SEEKS PARTIAL RECONSIDERATION OF PRB-1 PETITION DENIAL

The A-Double-R-L will continue its battle to minimize or eliminate restrictive laws that keep hams from putting up antennas.  This as it decides to file for reconsideration on a recently denied request to have the FCC expand the scope of PRB1,  Rick Lindquist, N1RL, of the ARRL Audio News has more:

-----

The ARRL will ask the FCC to partially reconsider its dismissal of RM-8763, the League's 1996 petition that sought to strengthen and clarify the limited federal preemption policy governing Amateur Radio antennas known as PRB-1. The League also agreed to fund a Florida antenna case with PRB-1implications.

In its petition, the ARRL wanted the FCC to prevent states and localities from enacting provisions that frustrate the intent of PRB-1 or make it costly to apply for permission to erect an amateur antenna. The FCCdismissed the petition in its entirety November 19 and indicated it was unwilling to go beyond what is already spelled out in PRB 1. "We continue to believe that the standards the Commission set, that is 'reasonable accommodation' and 'minimum practicable regulation', have worked relatively well," the FCC said.

The League will ask the FCC to reconsider two important aspects of the original petition. Meeting December 4 in Texas, the ARRL Executive Committee voted to instruct the League's General Counsel to seek reconsideration of the FCC Order regarding the application of PRB-1 to restrictive covenants and to excessive costs that localities might levy or require in order to install an antenna structure.

In its dismissal, the FCC pointed out that PRB-1 excludes restrictive covenants in private contracts as "outside the reach of our limited preemption." The Commission added, however, that it "strongly encourages associations of homeowners and private contracting parties to follow the principle of reasonable accommodation" with respect to Amateur Radio.

In addressing zoning laws and application costs, the FCC dismissal Order asserted that the PRB-1 principles of "reasonable accommodation" and "minimum practicable regulation" already provide sufficient guidance to communities. Local zoning ordinances should be written so as to "not impinge on the needs of amateur operators to engage in amateur communications," the FCC said.

In a related action, the Executive Committee agreed to have the League fund an appeal in a Florida Amateur Radio tower case. Lenard Persin, WB4HZQ, had applied to Seminole County for a special exception to a 35-foot tower height limit to build an 80-foot tower on his nearly one-acre lot. Initially granted, his application was later denied after a neighbor appealed. Persin appealed in federal court, and the ARRL filed a "friend of the court" brief in the case. On November 2, a US District Court in Florida ruled for the County, saying it had "properly balanced Mr. Persin's interests with the needs of the community."

In its November later dismissing RM-8763, however, the FCC declared that, given the express language of PRB-1, "it is clear that a 'balancing of interests' approach is not appropriate."

-----

In addition to filing the reconsideration request, the ARRL 's President Rod Stafford, W6ROD, has appointed a committee to study how the League provides support for antenna cases.  (ARRL)

**

## FCC INVESTIGATING SOUTH CAROLINA EXAM SESSION

Acting on information aparently supplied by the ham radio community, the FCC has begun an audit of a South Carolina ham radio test  session.  Speaking on Hap Holly's RAIN Report Enforcement Log,  the FCC's Riley Hollingsworth K4ZDH, that there have been claims of some major problems with this particular exam gathering:

-----
Hollingsworth Here
-----

So far the FCC has sent letters to the VEC's that conducted the session asking them to verify the authenticity and accuracy of the paperwork.  They have also directed for hams who attended a W5YI session to retake their tests at an ARRL sponsored VE test.   (FCC, RAIN)

**

## FCC COMMERCIAL RADIO FORFEITURE WATCH

Hams are not the only ones feeling the FCC's sting. A $4,000 fine has been levied against WPBZ FM of Indiantown, Florida. The FCC alleges that WPBZ broadcast a telephone conversation without first informing the party to the conversation of its intention to do so.

Meantime, Entergy Security Corporation has had its FCC invoked fine reduced from $12,000 to $9,000. Entergy had been charged with acquiring control of two microwave stations without prior Commission approval. (CGC Communicator)

This is Newsline, heard on bulletin stations around the world, including the Ashland Amateur Radio Club repeater serving Lincoln and Omaha Nebraska.

**

## NEWSLINE TEMPORARY SCHEDULE CHANGE

I'm Bill Pasternak, WA6ITF, with word of a temporary schedule change for the release of Newsline. Beginning with next weeks report number 1167 and continuing until at least after the FCC releases its Report and Order on restructuring the United States Amateur Radio Service, Newsline will release its latest newscast at the close of government business each Friday. That is 3 P.M. Eastern and noon Pacific. Doing this will give us the ability to bring you any news regarding restructuring should it occur at the end of the government business week.

Once again, effective with Newscast 1167, the release of Newsline will be moved back to Friday at 3 P.M. Eastern. Please adjust your recording and playback schedules accordingly. This revised release schedule will remain in effect until the Report and Order on restructuring is announced. Now back to Mert Garlick, N6AWE.

**

## ARRL TO OREGON SCIENTIFIC: 433 MHZ IS A HAM BAND

The ARRL's Lab Supervisor Ed Hare, W1RFI, has written to the Oregon Scientific supply company over concerns about a product that the company advertises as operating in the 433 Mhz ham band. In his letter to Oregon Scientific's Josh Cress, Hare informs the company about the anxiety on the part of the ham community over a remote-reading thermometer, that uses 433 Mhz to transfer data to the base unit.

Hare explains to Cress that devices such as this thermometer are regulated as unlicensed transmitters by Part 15 of the FCC's rules. Hare says that Part 15 does permit some higher-powered unlicensed operation on nearly any frequency above 70 Mhz.  But he adds that this high-power operation is limited to very brief transmissions, for remote-control purposes, with requirements that the device turn itself off after 5 seconds and that it not transmit at regular intervals.

Hare says that Part 15 does permit much lower power on virtually any frequency, but at 433 MHz, such low power would be useful for only a few feet at best.  He also reminds Oregon Scientific that Part 15 requires that most intentional radiator devices be "Certificated" by the FCC prior to their being offered for sale.  He tells them that certification is issued by the FCC based on the test data supplied by the manufacturer as part of the application. Hare says that this test data will very much help to determine on what basis this device operates on a frequency allocated to the Amateur Radio Service.

Hare has requested that Oregon Scientific provide the League with the thermometers FCC ID number and any other technical data .  Hare isays that he hopes to help resolve the matter without FCC assistance if Oregon Scientific can answer the questions about the device and its operation.  (VHF Reflector)

**

## FCC TO WOKIE:  NO BROADCASTING IN THE HAM BANDS

An Oklahoma ham who had sought a rules change to permit broadcasting in the UHF ham bands has had his request deniewd by the FCC.  Mile Reynolds, W0KIE, had asked the FCC to permit hams to make one way transmissions to the general public in the 70 centimeter bands and those above it. The FCC dismissed his petition without ever assigning it a rule making number.

Reynolds who operates the W0KIE Satellite Network has until recently been the provider of satellite distribution of the Houston AMSAT Net, This Week in Amateur Radio and several other ham radio special interest programs.  At airtime it is unknown if W0KIE plans to file an appeal.  (Listener reports)

**

## UNYREPCO TO COORDINATE DUTCHESS COUNTY NEW YORK REPEATERS

Is repeater coordination about to reappear near the New York City area?  Possibly, as members of the Mount Beacon Amateur Radio Club vote toadopt the Upper New York Repeater Coordination Councilas the repeater coordinating agency to serve Dutchess County, New York.

Dutchess County lies to the North of New York City proper.  According to Lloyd Frink, KC2AGL, writing in the Hudson Loop electronic newsletter, the Mt. Beacon club took this action at their December 2nd meeting.  This, following a discussion on the present status of amateur repeater coordination activities, or lack thereof, in the Dutchess County area.

As reported, almost four years ago the Tri-State Amateur Repeater Council that previously had served the area slipped into inactivity and disappeared.  All attempts to revive it or to form a new coordination council have met with strong opposition from New York City and Northern New Jesey repeater system operators.  Connecticut finally broke ranks last year and formed its own statewide coordination group.  Now, the Uppper New York Repeater Coordination Council has expressed a willingness to serve some of the area previous served by Tri-State and the Mount Beacon club has accepted the offer for the area that their repeaters serve.

The Upper New York Repeater Coordination Council is one of the nations oldest and most successfull volunteer coordination bodies.  It has has been active in amateur repeater coordination since 1973 and already has agreements in place for cross-coordination reviews with neighboring repeater councils.

KC2AGL says that the Mt. Beacon club hopes that in choosing the Upper New York Repeater Coordination Council as the representative of its repeaters that the group is setting a positive example.  One for other neighboring counties in need of repeater coordination to follow.  (Hudson Loop)

**

## NEW LAW MAKES EVERY CELLPHONE ABLE TO CALL 911

Will cellular telephones now be challanging ham radio in the area of public service communications?  Thats the question on the minds of hams involved in public service and emergency communications have been asking since President Clinton signed legislation making 911 the official emergency telephone number nationwide. This, for both wired and cellular phones. The measure also calls for development of technology that can track mobile callers.

The White House says that this will allow average citizens with wireless phones to speed responses to highway accidents, crime scenes and natural disasters.

What all this means to ham radio is hard to predict. It wll probably reduce the need for radio amateurs to report traffic accidents. This as cellular and P-C-S monthly charges continue to plumet making mobile phones available to more and more members of the general public. (Adapted from published news reports)

****

### HANDI-HAMS NEEDS VOLUNTEERS

The Handi Hams say that they need more volunteer readers to record rig manuals onto cassette tape for the blind.

The service group is also looking for hams who have the equipment and time to scan manuals and books into text file format. If you can help, please contact Nancy Meydell for a Handi Ham volunteer application at 612-520-0512 or by e-mail to nmeydell@courage.org. (Handi Hams)

### FCC COMMISSIONER WILL NOT RUN FOR CONGRESS

Federal Communications Commissioner Gloria Tristani says she plans to stay in her current job and not seek election to congress.

According to Tristani, she had given some serious thought to a congressional bid from her home district in Albuquerque, New Mexico. But the Clinton administration has urged her to stay at the FCC and she has decided to do so.

Tristani is one of three Democrats on the five-member commission. (Published news reports)

**

### AUSTRAILIAN ATV CHANGE OF HEART

In ATV news, the Australian Broadcasting Authority has had a change of heart concerning the future of an
Amateur Television repeater operating in the Brisbane area.  The ABA had originally told the repeaters sponsor that
the machine would have to leave the air to make way for testing of a new commercial digital television system.
Brisbane area hams mounted an offensive of their own  They said that there was no reason to take the ATV
repeater off the air, arguing that the two should be able to co-exist.  Peter Jones, VK4YAC, was one of those who
helped the Australian Broadcasting Authority change its mind:

-----

Jones Here

In-Q:   The ABA has had...
Out-Q: ...late next year.

-----

The idea to keep the Brisbane ATV repeater on the air as digital television broadcasting tests begin is a good one.
It will provide some interesting data on the compatibility or non-compatibility of digital and analog services
attempting to share the same or closely adjacent spectrum.  (Q-News)

**

SOUTH AFRICA

The  Board of Trustees of the independent South African Amateur  Radio Development Trust have bestowed the
Zed-S Radio Amateur of the Year Award on Chris Turner ZS6GM.  It has also named Henro Ritchie ZR6RIT as its
Young Radio Amateur of the Year.  (SARL)

**

AMSAT UK COLOQUOUM 2000

AMSAT U-K has put out its first call for papers to be presented at next summers ham radio space colloquium.
Jeramy Boot, G4NJH has the details:

-----

The 15th AMSAT-UK Colloquium, "Amsat Space 2000", will be held at Surrey University, Guildford, Surrey, U.K., from Thursday 27 July to Sunday 30 July 2000.

Amsat-UK invite authors to submit papers, about amateur radio space and associated activities, for this event and for the "Proceedings" document which will be published at the same time. We normally prefer authors to present the papers themselves rather than having someone else read them in the authors' absence, but we also welcome "unpresented" papers for the document.

Offers of Papers should be submitted as soon as possible; the final date for full documents to be received is mid-June 2000 in order that the "Proceedings" document be available to participants.

Submissions should be sent to G3RWL by e-mail to g3rwl@amsat.org

Jerany Boot, G4NJH
-----

Again, those dates are next July 27th to the 30th at the University of Surrey in the U-K.  (G4NJH, AMSAT-UK)

**

## AMSAT-OSCAR-16 SILENT

AMSAT OSCAR 16 appears to be temporarily QRT.  LW1DMO reports that the satellite went silent while in range of his ground station in Buenos Aires at 02:35 UTC on December 12th. The satellite was also monitored on 00:45 UTC on December 13th at KD2BD in NewJersey, and was found to be silent.  AO-16 had been operating for over 1800 days without a software reload or an interruption in service before this problem occurred. (AMSAT BBS, Spacenews)

**

## DX AND CONTESTS

In D-X, members of the Carolina DX and Roswell DX Associations will be on the air during the month of January exchanging the call WY2OOO with other operators around the World.  This operation will begin at 0000 UTC, January 1st, 2000 on all bands from 160 through  2 Meters.  QSL the WY2OOO operation with an S-A-S-E to K4MQG.  (K4MQG)

The 5-9-9 DX-Report says that  that Lawrence De Milner, W8NRB, has been active as from Nepal as 9-N-7-R-B since mid-September.  Listen for Lawrence  mainly on 20, 15 and 10 meters S-S-B.  He willbe there for some time. Q-S-L via W8NRB at the W-8 Bureau.  (59(9) DX Report)

**

## NOTE TO WEB TV USERS

And finally, this note for those of you who listen to Newsline in Real Audio over the Internet.  Tucson Amateur Packet Radio has upgraded its audio server to the latest Real Media G 2 software which supplies far better audio quality than ever before.

But there is a problem for users of Web T-V users.  Simply said, Web T-V is not a real computer system and it does not currently support Real Media G 2 technology.  According to Tony Gardner, N4DFM, who is one of our regular listeners, Web-TV users petitioned Web-TV for Real Audio G2 a while back. About a month ago, Web-TV users received an upgrade, but it did not include Real Audio G 2.  Also, a Real Audio G2 arrangement that was posted on the Web-TV web site is gone.

While we cannot help with most Web T-V problems, for Newsline listeners there is a solution.  Mark Bohnhoff, WB9U0M, in Chicago maintains a Web TV compatible Real Audio site for several services including Hap Holly's Radio Amateur Information Network and Newsline.  To get to Mark's site go to www.arnewsline.org and scroll down until you see the link to Bohnhoff Mediacasting.  Click on it and then click on the box marked Real Audio 2 at 14.4.

Our thanks to Tony Gardner, N4DFM, for bringing the matter to our attention and to Mark Bohnhoff, WB9UOM, for providing Web T-V listeners with a solution. (Newsline)

**

CLOSE

With thanks to the ARRL, the CGC Communicator, the FCC, the Hudson Loop, Spacenews,RAIN and Australia's Q-News,  that's all from the Amateur Radio Newsline.  Our webpage can be found at www.arnewsline.org, and out e mail address is newsline@arnewsline.org.  Also, the address for the Newsline Support fund is Post Office Box 660937 in Arcadia California.  The zipcode is 91066.

For now, with Bill Pasternak at the editors desk, I'm ____________ wishing you the happiest of holidays from all of us in the Newsline family.  And less we forget to say it, we sincerely do thank you for listening.

Newsline is copyright 1999 and 2000 and all rights are reserved.

Yes.... Every feature I want and some I don't.

> Whats it put out?

Stock about 2-8 watt AM carrier and about 25 pep. 30 Peak pep on SSB.
Fm is the same as the AM carrier..

My Modulator and tune job = 1 to 8 watt carrier. 40 pep from any dead key on AM.
SSB 40-45 watts. All this without ripping the Limiter.....

>
> Is it really effective at disguising voice?

Not really. It is a novelty. If you use enough to where people can understand you then it is easy to pick out the voice and voice pattern. If you use to much then people can not understand you at all. I do not use mine at all.

>
> Where can I get one over an internet store?

Many places..

Exports R US (steve is a friend)
http://hometown.aol.com/CBs313/Index.html.
Bills2way.com
Tomasdistrubuting.com
Copper.com ( I got a bad one from coppers once)

And many others.....

All in all the king of the Exports. There are better quality radios available. For instance the president line of radios. But the Galaxy High level audio gets the job done. If you are mainly an SSb talker then get president radio. If its loud AM you want get the 99v. Oh and my Modulator is on www.pantherco.com under mods then MC Turner....

Good luck..

MC

You are going to get that when you deal with this many people.  Instead of believing everybody that posts sit back and read them all and then use your intelligence and experience to absorb the info that you read.  If you do that then you might get the answer.

State that in your post.. Let someone know: I am guessing here BUT...

> You guys just blurt out shit when you have no Idea what
> you are talking about.

True. Some people do that. The point of this group is to get help and help others.. I wish it would go back to that...

Toll was out over the weekend in AZ. We where on the bowl and we thought we heard you out there on Saturday evening. I was calling buy 177 on the little Johnson. I was talking with Blue magic in the grass when we heard you.. I called out but then Worldwide 471 keyed up the 16 pill and then stopped buy so we gave it a rest...

See ya

NO.. Allot of the transistor base amps run higher voltage than I would use to
run a radio. some of the better units idle at 20 volts internally. Of course
they sag under load so the pills see 17-18 volts. I would never run a radio of
that much. The Palomar is designed to run external devices at 13.8 volts..

MC

I have heard of people using 220 volt AC motors to turn several alts to run a 8 pill or 16 pill with good luck.  It can be done.  Back when I used to compete in IASCA car stereo competitions I knew a guy that had a Hydraulic pump mounted up on the engine with hoses that ran back to a alt rack in the back of his blazer. He could spin 8 200 amp alts no problem with less load on his engine.   I cant believe that nobody is doing this. You can vary the line pressure to get different RPM's on the alts. Key down and then start opening the valves until the desired RPM and volts are obtained.  Split the alts into groups.  Hit one valve and then get say 3 spinning.  Then at the half mark hit another and get all 6 spinning with high volts...  I am sure one day I will see this...

Ok for a true AM signal you would need to have the carrier at 1/4 of the peak power to be at 100% modulation..  So a 4 watt carrier would need a 16 watts peak. This is the preferred method.  Reducing the carrier will exaggerate the modulation.  Some of us call this : Suppressed carrier AM modulation.  You gain audio by reducing the carrier in most cases.  Running a high carrier like say 8 watts with the same setup will not allow "room" for the AM signal to reach 100% output modulation.  In other words it would sound tight or pinched.  You can get away with running a high carrier is some situations.  Most of these setups are Class C battle box setups with radios that are severely over modulated. In this case even though the carrier is high it still sounds "loud" Even though the loudness people hear is really distortion..  I am from the group of people that like to run a station that has more than enough room for the output signal to produce 100% mod.  I believe that whoever is producing the most audio and the highest peak power will win over a guy that keys up and back swings... All the while it is easier on the equipment to key less and swing high....

The only way to calculate true power is across each load or resistance.

(1.) The true formula is Current (I) squared Times Resistance (R)

(2.) Now that you have the power you can divided by the voltage and get the current. But keep in mind that the current you just found is only true across that load!!!!!!!!!!!!!!!!!

Basically this gets you no where since you need current in the fist place to do what I just said. THAT WAS MY POINT YOU GUYS ARE GOING ABOUT IT ALL WRONG.

look AT STEP (1.)

(a.) Now you know this is the only true way to find Power!
(b.) You already know the power cause you have a Bird meter or what ever.
(c.) you know your load (I hope).

Your new formula is CURRENT= THE SQUARE ROOT OF (POWER /RESISTANCE).

True..

>
> Swing Kits will increase modulation......which in turn make you seem
> louder.....

True..  I will add that I only run a modulator style setup if the radio is going to be used to drive an amp that likes a low keyup but will make use of some good peak power.   In other words I setup modulators in radios if that is needed to get an amp output of 1/4 the peak with good audio and good peak power.

> and despite this argument of due to lower
> carrier....etc....etc....  I have a question for all of you I suppose....
> who the hell hears someone's carrier when talking skip?!?!  Just a
> question....
>

That is true.  The guy with the most audio and peak power will be heard...  But

it still is impressive to hear a huge carrier come out and wipe the CH clean
even if the audio is lower.. :)

THE REASON YOU GUYS CANT FIND THE CURRENT IS BECAUSE YOU ARE USING THE WRONG LOAD RESISTANCE!! You are using 50 Ohm that is your load at the antenna do you care how much current is at the antenna?? I don't care. My point is you can only find Current in side the circuitry on single resistances not A general overall resistance!!!

Unless you can tell me the resistance of the amplifier. Put a multi meter across the Power cables of an amp and tell me what you get!!!!

If your meter reads 50 Ohms call me an asshole.
If it doesn't now you know why I paid for my education!!

I never dealt with them so I cant say first hand, but from what I hear they
are not the type of people I want to do business with.
I'm sure that is no sweat off there backs but I bet the would be happy if
the made a nice profit off of me with all the Dave Made Amps I bought.......
Its too bad they dont sell them anymore!

DOE!!!!!

I guess if everyone had there own river in there back yard we wouldn't need
the water company at all would we? Come I'm talking day to day logic here.
Your talking longshots.
How often do you see batteries explode?
How many Leece Neviles have you seen go bad because of over drive from a CB
amp? YES I KNOW IT CAN HAPPEN BUT TELL ME HOW OFTEN IT DOES AND HOW MANY

TIMES YOU SAW IT FIRST HAND!
Buy the way if your worried about a few pennies in gas your in the wrong
hobby sine it is one expensive hobby.

"Sean" <bigfoot1@megsinet.net> wrote in message
news:Jek74.138$ct.12895@news.corecomm.net...
| Boo is right.  The alternator system needs to be able to supply ALL of the
| current with no sag at any time.  The batteries are simply buffers that
CAN
| bog down the system IF the alternators can't keep up with the demand.
After
| all, even after you turn off the faucet, the river still has to fill the
| storage tank that you just depleted.
|
| More alternator with less battery equals lower maintenance, less chance
for
| boiling over or explosions, damage to one's self or the vehicle from
fumes,
| less weight and wear and tear on the motor / trans, better gas mileage,
| etc...  The alternators only produce as much power as needed on demand.
| Sean
| >
|
| -=PEAKABOO=- wrote in message <83k29s$q91$1@nntp8.atl.mindspring.net>...
| Do some testing and see if more batteries are better, break out your dc
| current transformer and take a current reading on the wires feeding the
| batteries from the alternators, then take a reading between the amp and
| the batteries you will see a little more current draw between the alts and
| batteries, even if you are charging .5 volts above battery voltage, now
| increase the voltage to say 2 volts above the batteries and see how much
| the current draw increases at the alts over what it is at the amps, also
| note that there is still a load on the alternators even after you unkey,
| the more batteries you add the more current draw on the alternators. Now
| if you do not have enough alternator and are pulling down to battery
| voltage then you will see the voltage drop less with more batteries, But
| it will only wear your alternator out sooner by adding more batteries
| unless you charge right at battery voltage. If your alternator is just
| barely big enough to handle the job and it works fine with say one battery
| and you go in there and add 6 more batteries you will see less watts, now
| all of this is assuming the system is "truly" wired with enough conductor
| on both positive and negative sides of the system from the alternator to
| the amp.
|
| Now this my "simple example" and it has a very "simple concept" its called
| time tested truth, and not to be a knowitall but I will stand behind this
| one until the end.
|

I have heard that if you cut the modulation limiter it will give you more modulation and make you sound super loud.  I have read this in tune-up books as well.

I have also heard from people(Lou Franklin and others) that if a c.b. tech says to cut the limiter, run fast as you can.  Furthermore stating that cutting the limiter causes distortion and doesn't really do anything positive to the radio, only causes damage.

Who is correct and why?

The President George radio has the best and cleanest RX out of any radio I have. It beat out all of my radios including my Yaesu and 2510. You also get a 45 watt (bird) output and probably the best SSB radio ever..

MC

Mdd327 wrote:

> Boredom has finally set in. I have decided to make a change to my mobile. I would like to put my proven Grant XL on stand-by (not 10-7). I'm looking for a new radio to play with. Since it is possible to make almost any radio talk, I need one that has good ears. The 2510 seems to be the front runner. The problem is they are no longer in production. Are there any new radios on the market with comparable RX performance?

To much deadkey input wattage or he is turning it while he is keyed which arcs the pot inside.  I think it is a 100 ohm.... Ask Toll..

Pat,
PLEASE,PLEASE,PLEASE, DON'T buy one of the CB/AM/FM antennas . They are just as bad as the horrible thru the glass antennas . There is no comparision to the Wilson , you are comparing apples to oranges. If you will let us know what specifications you need for you particular interest we will tell you what type of antenna you would be happy with.
If you want real performance and want everyone to look , just get a 108" stainless steel whip like I have on my Ford Ranger. I also run a base loaded hood mount when I am restricted to a certain height . Like in a parking ramp or through really low bridges.
Let us know your stipulations,
Tinker

I just realized the key words "slow scan".... Oops.

Hank Aaron wrote in message <837dd1$knc$1@nntp2.atl.mindspring.net>...
|Prozac,
|
| I have yet to try this, or even give thought to whether or not it would
|work... But, make yourself a little 5/8 wavelength antenna for channel 3 or
|4 (dont have my ARRL handy, so, I have no idea what ranges video/audio
would
|be).... then buy a line amplification unit from Rat Shack, then hook
|everything up starting with a VCR set to whatever the antenna was built
|for.....   VCR - Amplification Unit - Antenna
|
|As I said, I haven't even thought about it, but now that I typed it out, it
|may work to a point, but nothing like a neighborhood type deal.....  There
|ARE cheap kits usually being auctioned on EBAY..... other than that, do a
|search on the web...

I am sure you would be able to get some R's up if the pulley system was built
right.  He really had some R's on his setup..

this may sound stupid..if so humble your intelligence and give me the benifit of your experience...

I have a President 2510...and was wondering if i picked up an older 2 way fm radio...Motorola mebby could i use the 2510 tuned to the same freq to communicate with it...and if so where could i find such a radio......

also wondering if anyone knows anything about the RS DX-394 Reciever....is it any good...who is the real OEM...i know RS doesnt make alot of their stuff...

there is a guy getting a mobile setup by davemade with a seperate motor in
the back of an old panel truck. The motor's rpm will be electronically
controled from the driver/operators seat , the full compliment of
alternators will be mounted at the back of the motor with a short drive
shaft and some large pulleys etc to spin the alts, less chance of breaking a
crankshaft and all the HP right there  of course there will be much more to
it than this but this is where it is headed.

Everything would be done using the exact same setup, or for that matter all
test are done in the same vehicle which would prove to be the best way to
setup to win in a keydown.

OK,but the ads lead you to believe you can run the amp at the same
time as powering accesories,they would have to be damn small
accesories,you can't even use this for a big radio to drive the amp as
the PS is just adequate for the amp alone,what the hell,I still like the
amp for the price.

Look for a copy of "Yagi optimizer" I used it to get max forward from a 13 element 14'boom @VHF and cried when it told me to remove 2 elements but after adjusting the spacing the results were great.Somehow I lost my copy.

No.  In comparison to the tube amps of yesteryear, they are junk.

However, with what is on the market today, you might be better off with them rather than something else.

For a monoband amp, if you can afford it, the Tennesee Walker amps are great!  Purchase one, and you should never have to purchase another tube as long as you live!

Toll Free

Never had a problem with Steve.  Even the guys who purchased items from him
that I had referred were pleased.  And we're out here in BFE Mohave!  Seems
like someone is trying really hard to "throw salt in Exports game..."
because Steves got much business goin' on in this arena.

Keep up the good work, Steve!  Peace and have a Merry Merry and a Happy
Happy!

137... back out!

They are a pain to put up, as you want to put them in the Diamond
configuration..

They do match down quite well.

They are "quieter" as far as picking up noise, but the signals you want to
hear are just as loud as with a Moonraker type beam (Yagi or Quagi)...  The
shorted style of the antenna makes them work like the DC Grounded type
verticals.

Hope this helps.

I do believe Jay was joking about the Starduster coming in a close 6th
behind the Window mount.

But I do have to agree with Jay about the Penetrator 500.  If you've seen
Jay's antenna farm going in the Mohave for his own R&D-T&E on his new and
improved design of the P500 (the top-secret P500II), you'd agree with him as
well.  Antenna efficiency readings, radiation pattern, and all that jazz,

man!

Otherwise, every individual has their favorites.  Some like the Stardusters... others differ.  I think HOMEBREW is the way to go.  You go Jay!!!

137... back reading the neighbors paper!!!

Why would it be "hard to achieve the rpm's needed for what we do?"
Exactly how many RPM's do you turn your alternators at?  What would be the
difference between audio amplifiers and RF amplifiers?  Audio has more
transients and surges like SSB, but it also has larger surges than RF.
Audio equipment doesn't run at 18 Vdc, but the only difference there is
regulation.  That particular Blazer ran 12 batteries I believe plus a load
of 1f stiffening caps.  I forget what size hydraulic motor he had running
those alts, but with the proper pullies you could do anything.

    I'm fairly new to the big amp and keydown thing so don't flame me for
asking.  Why doesn't everyone use AC for the big systems?  It's easier to
make AC than DC anyway.  There are a few systems that use 200 amp Leeces to
produce AC as well as regular battery charging.  Isn't there more potential
from and AC amplifier than DC.  I'm just curious my dad and I were
discussing this.  We're in the hydraulics/generator/automotive electrical
system business.

Well I have yet to see one at a keydown with this type of setup other than
one that was close which was 55's chevy van I beleive he has a 350 chevy in
the back but his alt's were mounted on the front of the motor not the back
whcih can sustain the tremendous torque and I didnt see any electronics
controling his  motor's rpm etc  Any idea how many 250's you can fit and run
with this setup rather easily. Plus you don't have to worry about breaking
down on the line from over reving etc and not being able to drive it home.

I am glad to see you men are getting ready for the Y2K onslaught. We may be
in need of a person with radio experience. Your radio stations could be used
as relays. We are trying to set up an early warning system.
The UN/NWO/AMISH forces are far more advanced than we expected. Can your
radios JAM satellites?

You could tune some of those frequencies with a scanner.

Most were made by Sangean. My DX-440 is a Sangean ATS-803A.

Ebay pulled all auctions for linear amps in the CB section today at 4:00 P.M. even thought the item descriptions made no reference to them being used on CB frequencies . Their reason? THE FCC

Dear Storm Chaser (stormchaser478@webtv.net),
We regret to inform you that your eBay auction:
221891956 PALOMAR 225 LINEAR **NIB**
has been ended. All fees associated with this auction have been credited to your account. Please refer to the following page to review the items that are not allowed to be sold on eBay:
http://pages.ebay.com/help/community/png-list.html
We have been informed that your listing contains items which may be infringing or potentially illegal, namely, CB or certain linear amplifiers, which are in violation of FCC rules and regulations Part 95, Subpart D, section 95.411.
**IMPORTANT NOTICE: Please be aware future incidents of this nature can lead to the suspension of your account. If you have any question regarding whether or not an item is allowed to be sold on eBay, please write to us at moreinfo@ebay.com before listing the item. Multiple

violations for listing prohibited items can result in the suspension of
your account.
We thank you in advance for your cooperation.
Please feel free to contact us with any questions or concerns you may
have on our existing listing policies.
Regards,
Juan eBay (ended@ebay.com)

I dont JJ? Perhaps you should go and get pissy with Jay some more... Gee...
Go up and start from the beginning smelly boy, and you will see my
explanation as to why "swing kits" ARE beneficial.....

If modulation of negative peaks exceed 100%, what will this do?

JJ wrote in message <385EC7E4.2919@no.net>...
|Hank Aaron wrote:
|>
|> Arrrrng! Wrong! Thank you for playing "Do you know your CB hobby"

Been there done that.... Replaced MANY 4 pins to five pins and used a 9
volt regulator in the radio and sent the positive to the mike via the extra
pin.... Did the same with 5 pins also.... Expensive to some... but, there
is nothing like knowing your microphone will not run out of juice, and will
always be constant..... unless something goes "wrong".... of course..

If you build the motor right you dont have to worry about overreving
unless you lose a couple of tubes at full throttle and take the load off
of the motor without letting off the gas, Hell in ac sky you want dem
volts to get dem watts so you hammer dat gas pedal, in dc you can use an
adjustable rev limiter and then use a solenoid to open the throttle, you
start out manually giving the vehicle gas and then move your foot off the
pedal because the solenoid is keyed by the radio by giving a dc ground to
a relay that controls the solenoid.
The controls for the adjustable rev limited are relocated inside the cab,
this idea was not copied anywhere but from in my head and I can attest
that it does work.

A single capacitor of this size and voltage would have a diameter
of about six inches and would be about 10 inches tall. It would
probably cost at least $80. I don't know if you could find one,
especially that cheap. However you can parallel to get the
value.

The best source that i know of for cheap electronic components
is M.E.C.I. or Mendelsons Electronics Corp. Inc. You can purchase
about 30 caps to get the 1 farad that you need. (120 amps?)
It will cost about $80

We have already thumb the idea around and did not see a real gain in doing this over the way we do it now, you are right, with the right pulleys you could do a lot, but I have yet to see a stereo setup that matches the equivalent to what some of the big charging systems consist of in keydowns, an audio amp works on a whole different concept than RF amplifiers do, you can lose volts on an audio amp and not see a significant drop in wattage like you will in RF amplifiers, our amps are not a " regulated" supply.

That is not what your saying, you didn't say shit until someone gave you
something to agree with, if you are such an educated guy you will see the
original point, with your "knowledge" you should have a dc amp meter lying
around that will read large amounts of current, do the original test
earlier in this post and then come back with an answer, but until you have
dealt with charging systems enough to do more than assume your right it
might be best to just read the mail.

Its not automatic, Wanker2222181234. It is a fact. Before the sales of Davemade stopped, no one ever posted that Exports was messed up. Ever since then, Exports R Us is seen as downers. Hmmmmmmmm...

I have nothing against Dave or Exports. Both I have done business with and both are very exceptional. But as soon as Steve started pushing the X-Force line, Exports became rejects. Don't tell me that Steve all of a sudden started missing orders, shipping orders late, or doing people wrong.

Now this Exportradios.com appears on the newsgroup. BADDABING! Exports R Us gets flamed. Any connection there?

Get real people!

I run a Jo-Gunn Super Audio flat 6 and am very happy with the results on DX.  I
also have a 2 element V-Qaud that I am not as happy with, although I have
talked DX.  Good Luck.

If you divide volts (used) into watt's you get Amp's . Try that first. I>E> 10
volt's goes into 300Watts 30 times =30  Amps

The amp is a 10 out of 10.  This amp is clean and will do true 300W average power with 10W average modulated.  There are no appreciable (measurable) harmonics, I have a flat (ok 1.2:1 at a tuned 27.185MHz) SWR with a mag mount and a super penetrator antenna. The amp has been in use for only 6 months!  I am upgrading to a 1200.  The price is firm, $300 plus shipping.  If you would like to see it in person I live in the Washington DC area.  Email a response.

John

I would like a little input on the Quads that this company sells. does
anyone own or has anyone ever used one of these antenna? Are they as good as
they claim? Are they easy to match in?  Im thinking about replacing my
Moonraker 4 with something else in the spring.

I know enough to know that swing mods do nothing but make cbers happy
because all they do is make meters swing. The modulation is no better
than a carrier modulated up to 100%, however most cbers don't know that
so ARRRRNGGGGG!! Thank you for playing even though you don't know the
answer.

To modulate a 200 watt carrier to 100% requires 100 watts of audio, the
peak power at 100% modulation is 4 times the carrier or 800 watts.

Why do you automatically  think someone is out to throw salt in his game 3 seperate people have posted thier displeasure with him can they all be wrong? These people said they have also done business with him before so they may have a point.  people like him because he sells them thier  cb stuff when he screws them over they will be on here complaining too.

I use two garbage can lids with wet newspaper in the middle. the funny pages
work well because the color ink makes an excellent insulator.

| A single capacitor of this size and voltage would have a diameter
| of about six inches and would be about 10 inches tall. It would
| probably cost at least $80. I don't know if you could find one,
| especially that cheap. However you can parallel to get the
| value.
|
|
| The best source that i know of for cheap electronic components
| is M.E.C.I. or Mendelsons Electronics Corp. Inc. You can purchase
| about 30 caps to get the 1 farad that you need. (120 amps?)
| It will cost about $80

I'll tell you what... the FCC has made it a 'mission' to crack-down on 11-meter amps, and ANYONE (hams,c.b.'ers) freebanding. I have been reading about it in Monitoring Times, and Popular Communications magazines. They (the FCC) just busted two 'hams' for operating on 27.425 LSB. Not only did they lose their license, but ALL equipment was confiscated!  I don't intend for this to be a "scare-tactic,"  just the FACTS. So...use your gear wisely. In the 1970's, it was QUITE common to see the FCC vans in town! And that's what they want to get back to. Be CAREFULL.

Ebay pulled all auctions for linear amps in the CB section today at 4:00 P.M. even thought the item descriptions made no reference to them being used on CB frequencies . Their reason? THE FCC

Dear Storm Chaser (stormchaser478@webtv.net),
We regret to inform you that your eBay auction:
221891956 PALOMAR 225 LINEAR **NIB**
has been ended. All fees associated with this auction have been credited to your account. Please refer to the following page to review the items that are not allowed to be sold on eBay:
http://pages.ebay.com/help/community/png-list.html
We have been informed that your listing contains items which may be infringing or potentially illegal, namely, CB or certain linear amplifiers, which are in violation of FCC rules and regulations Part 95, Subpart D, section 95.411.
**IMPORTANT NOTICE: Please be aware future incidents of this nature can lead to the suspension of your account. If you have any question regarding whether or not an item is allowed to be sold on eBay, please write to us at moreinfo@ebay.com before listing the item. Multiple violations for listing prohibited items can result in the suspension of your account.
We thank you in advance for your cooperation.
Please feel free to contact us with any questions or concerns you may have on our existing listing policies.
Regards,
Juan eBay (ended@ebay.com)

You probably would want the batteries to filter out the extreme ripple
you would have from the alternator.  Up to you, though. Keep it on 11
meters (CB) and it won't bother me.

I am wanting to get a CB for my car since I do a lot of driving. I hear Uniden CBs are the bast. I have a handheld that I've used in my car before, but only get a couple miles range with it on the car antenna. I want a good one that isn't handheld, but mounts in my car. I want to get one with some good range and ability to hook up to a PA system. Are PA systems still legal? Where can I get a good loud speaker? I'm sure there are some laws on having a PA system, but I'm not going to abuse it or anything. Also, the CBs you put in your car, can you hook them up to your car speakers? What is a good radio and antenna combination for somebody willing to spend around 150 dollars? Forgive me if these questions sound dumb, but I really don't know much about them. I'm just wanting something to do when I'm on the road. Also, I'd like an antenna that isn't magnetic. I remember my old one would come off of the top of the ar when I'd get up around 65mph. I'd like one that I could clamp to the trunk lid without damaging the car or paint job. If anybody has any suggestions for me, I'd appreciate the info! Thanks!

If the negative peaks exceed 100% you get distortion and splatter
because exceeding 100% modulation on the negative peaks cuts the carrier
off. You can exceed 100% modulation on the positive peaks (up to the
limits of what the power supply can handle) and get a good signal as
long as you don't let the negative peaks exceed 100%, but this takes
special circuitry. The typical cb swing mod kit dosen't do it. I repeat,
all the swing kits do is make cbers jump up and down and think they have
a "big radio" because they see all the meters wildly swinging.

I've been planning to build a test rig to check sweep tubes, and (hopefully) match them up into sets.

My question is this;

What plate, screen, and grid voltages should I use for testing a "typical" sweep tube (6JS6, 6LB6, 6GK6, others)? In matching, should I match for current draw or transconductance (or both)?

If posting a response, please respond to me by email as well.

Thanks,
Tom Mitchell

It won't hurt anything to remove this cap. It is primarily there
to stop rf from getting onto the hi impedance mic lines going to the
preamp.
If you want to lower the tonal response of the mic you could try
increasing the value of the cap a little at a time until you get the

tone that you want. You will need to turn the gain up as you lower the tone because it will lower the output of the cartridge to the preamp.

Personally, I wouldn't run one of these mics mobile as they do seem to pick up hi freq. sounds like wind noises and such. That's even with the gain turned down. Otherwise a good mic.

My personal preference is, as some one else posted, a 575 M6 Astatic. I've always had the best luck, with my voice, using that mic.

They are absolute JUNK.  They eat tubes like crazy, throw tons of interference and suffer from low output.

I do know someone that turns those "sows ears" into "silk purses" though.

Not sure on how high your radio goes but low-band commercial FM rigs such as Motorola� normally will operate on a portion of the 30 to 50 Mhz band.

The low-split ones tune from 30 to 37, mid-split from 37 to 42, and high-split from 42 to 50 Mhz.  Some of the rigs can be tuned out-of-band with some modifications to cover the 10 meter and six meter ham bands.

Even if you could operate your cb above 30 Mhz, it would not be type-accepted to transmit on business or public safety channels.  I suppose it may be possible to get a low-split radio to operate down at 27 Mhz but I suspect that several coils and capacitors would have to be changed to move it that far out of band.

Hope this info helps.

Jim, W8EMS/9

> Doesn't help me a bit. If you had posted here, you would have helped "S.F.Gale". I have been on radio since 1977. I have a clue. Just because I don't hold a ticket, doesn't make me stupid. BTW, a 2950 will go to 32 MHz. My mobile scanner starts at 29 MHz, and I've monitored dummies using those frequencies on FM. Thanks for your thoughtful answer.

I have seen Leece's burn up also.  Why do you think that there are always so many " fresh rebuild's" available at the keydowns ????  Where does Leece get all of their cores to rebuild from ???  There are plenty of truck drivers that can attest that Leece's do burn out, and not from running mega-watts.

I just had a customer blow several batteries in a brand new van.  It wasn't pretty.  His regulator "slipped" and KA-BLOOEY !!!!  Luckily, he wasn't physically hurt.  His pocketbook is another story though.

What good is having a "mo-beel" that isn't mobile ?  Gas prices aren't getting any cheaper and i have better things to do with my money.

Plan on worst case scenario and learn to do things the "overkill" method and you will minimize your problems AND get better performance.  Sean

These are really good radios.  I've used 2 for years.  Install the required final it needs.  Sorry don't know the number of the final, but I'm sure you can locate it on the web.  Side band very strong, use a stock mike, swings to 25 watts.  AM strong, use a good power mike if you want to sound loud, swings to 15.  FM  very stable.  Use a stock mike.  Solid 12 watts with no swing whatsoever,  that's what you want on FM.  This suggestion might not work for you but this is what I use & the output is what I get.

Just don't let the tech take the transistor out for modulation.  You won't be able to use side band.  Over modulate.

We have them too.

Here you go JJ, learn something new... I dont feel like re-typing and explaining.... That is what books (in which the authors receive nice amount of funds) are for.... go to the library...

Cut & Paste of what I have already mentioned:

---

"Swing Kit" - Exceeds 100% modulation on the positive modulation peaks (easily demonstrated on a "scope"), positive modulation peaks can and more than likely will exceed 100% modulation without producing distortion.  This in fact increases the amplitude or power output of the CB.

Swing Kits will increase modulation......which in turn make you seem louder.....and despite this argument of due to lower carrier....etc....etc....  I have a question for all of you I suppose.... who the hell hears someone's carrier when talking skip?!?!  Just a question....

|>
|> If modulation of negative peaks exceed 100%, what will this do?
|
|If the negative peaks exceed 100% you get distortion and splatter
|because exceeding 100% modulation on the negative peaks cuts the carrier
|off. You can exceed 100% modulation on the positive peaks (up to the
|limits of what the power supply can handle) and get a good signal as
|long as you don't let the negative peaks exceed 100%, but this takes
|special circuitry. The typical cb swing mod kit dosen't do it. I repeat,
|all the swing kits do is make cbers jump up and down and think they have
|a "big radio" because they see all the meters wildly swinging.

|>
|> If modulation of negative peaks exceed 100%, what will this do?
|
|If the negative peaks exceed 100% you get distortion and splatter
|because exceeding 100% modulation on the negative peaks cuts the carrier
|off. You can exceed 100% modulation on the positive peaks (up to the
|limits of what the power supply can handle) and get a good signal as
|long as you don't let the negative peaks exceed 100%, but this takes
|special circuitry. The typical cb swing mod kit dosen't do it. I repeat,
|all the swing kits do is make cbers jump up and down and think they have
|a "big radio" because they see all the meters wildly swinging.

|all the swing kits do is make cbers jump up and down and think they have
|a "big radio" because they see all the meters wildly swinging.

Actually to be more precise; if negative peaks exceed 100% modulation, harmonics of the modulation frequency will be produced.  Not to mention downward modulation.

Anyway...... everyone is open to their own opinions.... however, remember your statement is just that..... You can "say" all day long that "swing kits" do nothing, how about some proof.  I would like to be objective about this.... though I HAVE provided THE explanation as to WHY "swing kits" are beneficial, and in fact -DO- something.  Your turn...

Is Radio Luxembourg still broadcasting?  We spent ten years in Germany a decade ago, and we listened to Radio Luxembourg nearly every night (of course, anything was better then the American AFN radio).

I was in Italy last year, but could not hear Radio Luxembourg because of a strong local signal.  I have tried to pull in their SW broadcast here in the US, but I get nothing today (perhaps they have changed frequencies).

Hey Hank Aaron,

About 8 years ago I put a swing kit in a radio and it seemed to work with an amp quite well. Almost 3 years ago I got one from Copper Electronics in TN. I followed the instructions on the install and turned on my radio and it started to smoke. As I was removing the device I checked with the instructions to see if I put it in right. I did. The radio is a GrantXL (my personal favorite!). At this time I'm batting about .500. Most of my Grants are tuned -out to maximum peak wattage and turned to about 2 watts or less.

Question: What does a swing kit do that my method does not?

========================================================
Again I don't see the connection between davemade and xportsrus the people
complaining  didnt get a radio or a palomar amp or something along those
lines. No one said anything about davemade or xforce why did you decide to?
Steve has been pushing the x force for quite sometime don't know where you
get this all of a sudden bs. As you should know when you get real busy its
hard to fill orders as quick as people want them. Ever wonder why you
sometimes have to wait to get amp from Dmade.

>

```
> Now this Exportradios.com appears on the newsgroup.  BADDABING!  Exports R
> Us gets flamed.  Any connection there?
=============================================================
I don't know what the connection is with exportradios  but maybe you can
play mr detective for us before you accuse dmade or anyone of doing this, we
all know that its bullshit and steve would never do his customers any wrong
he is a saint.

4-10 good buddie thats why I use caps to filter the ripple and use no
batteries.

Thanks Tnm,
>ftp://ftp.funet.fi/pub/ham/antenna/yagim311.zip
I only found an earlier version.

It'd DOS based.
ugh.

I was born with a mouse and have never been able to get my head around DOS.

How about one of you gentlemen out there putting in the figures I posted earlier.

Thanks

Phil / UK

Jay, where are you?

Radio Luxembourg pulled the plug a few years back.

Lack of advertising revenue I believe to pay for the utility bill on their 1.3 million watt tx!

Who listens to AM radio anymore anyhow?

Same thing is happening in the US I believe with some smaller stations going quiet.

R. Luxembourg's transmitter is now back on air and on 1440Khz but I believe they are being rented out to another organisation. Probably another bible basher!

See ya

Phil / UK

Try MCM Electronics. I bought six of the 1 Farad caps for $90 each.

Don't know if they still carry them or not-- these were ordered from
catalog 40A.  The part # is/was 60-1925.  The voltage rating is 20
volts-- may or may not work in your application.
73,

If the D104 is amplified (most are) there is no issue with impedence
matching. They work as-is. If the D104 is un-amplified, it is a high
impedence, and would need a matching transformer. But I suspect that you
would not be pleased with the audio level from the unamplified mike, on
anything but a tube rig (they were also high impedence)

Ok, here's the REAL deal. Swing kits are more "form" than "function". Yes, they can allow higher positive modulation, simply because they are lowering the carrier. The peak power is the same as it was before.

The downside is that you can NEVER exceed 100% negative modulation. At 100% negative, you are at ZERO power. Increasing modulation only widens the cutoff point. Modulation that is driven to cutoff will cause distortion and splatter. That guy that bleeds you all 40 channels, is probably running a badly butchered radio with a "swing kit".

As to the original question, "are swing kits beneficial?" The answer depends on your objectives. If your goal is to be loud, obnoxious, and cause interference to both neighbors and other Cbers, then the swing kit will help. If you goal is just to put out a good, reasonably loud, but CLEAN signal, then a swing kit will not do you any good. Trying to run one with the mod limiter still functioning defeats the purpose. You cannot take advantage of the huge positive peak without having to deal with the drawbacks of the negative cutoff.

There is a more complicated method called "controlled carrier" which allows the carrier ro rise in proportion to the modulation. Since the peak modulation is never more than 4 times the carrier(at its highest point), the negative cutoff can be kept right at 100%. But the apparent swing is still the same.

Actually in a properly tuned, symmetrical radio, 500 watts of carrier, with slight forward, or no movement would be peaking close to 2000 watts at 100% modulation (4X carrier power). A Bird meter tends to average the power, and the positive peaks will cancel out the negative ones. If both halves of the modualtion are symmetrical and equal, then there should be no movement during modulation. Any "swing" on an RMS meter indicates an imbalance in modulation. With an overmodulated signal, there is usually more "positive" modulation power than "negative" modulation power, since you cannot go below the zero power level at cutoff. As positive power continues to rise, it starts to show as forward swing, since you are now unbalanced. It may look good on the meter, but you are no longer "clean".

Negative swing happens when your amp does not have enough reserve to faithfully reproduce your peak positive modulation power proportinate to the carrier. The fix is simply to back down the drive power until the backward swing stops. Usually the point where the meter back swings to, is where you should then set the dead key power for, if you want to avoid further backswinging.

Shame the 101's were low level modulated..... But it does throw cold water on the myth that low level radios don't have the "punch" that high level ones do, all other factors considered.

I'd have to agree that I like the sound of old tube rigs, Trams, Brownings, even old Laff-a-lotts.

The big secret to getting CLEAN modulation out of a modern CB is to unlearn all that you've heard and read from "screwdriver tech" guides. Leave the modulation limiter functional. Adjusting it for 100% or slightly more, but not enough to cause squarewaves. Some radios have audio bandpass filters, that make the audio sound "compressed". These can be worked over to allow a broader frequency response, and a better tonal match to your mike. Most of this stuff requires some test equipment. A scope, an audio signal generator, and meters.
And remember, more is not always better. Be conservative with the mike gain. A mike that can pick up a dog farting in the next room, will be too loud for your normal voice, and will clip and sound compressed. If you have a modulation meter, it should be peaking at or slightly above 100%, and spend most of the average  talking time in the 60 - 70 % range.

This will not make you the loudest guy in the area, but when you talk, people will UNDERSTAND you, and your voice will not be hard to listen to.

While on the subject, do you think 2-1 farad caps will work for 200 amp
transformer?  Meaning do you think they will charge fast enough? And how
many time the operating voltage do the cap need to be rated at? Just a few
questions I wanted to through up in the air...

KRS

Has the radio been modified, and what does it come with? How old is it, and what area will it be coming from? COD?
Thanks,

It sure does.  His Ft 101 is real loud but still clear and not distorted.

I will take the blame here. I tried to say the only thing I don't like about Exports is that they don't sell Dave mades anymore. Every one took this the wrong way and thought I was talking bad about Export. If that is talking bad I hate to see what you call the guy that said he got charged on his Credit card but never got the radio. (that doesn't sound like the kind of business I would like to deal with).

=========================================================
| Again I don't see the connection between davemade and xportsrus the people
| complaining  didnt get a radio or a palomar amp or something along those
| lines. No one said anything about davemade or xforce why did you decide
to?
| Steve has been pushing the x force for quite sometime don't know where you
| get this all of a sudden bs. As you should know when you get real busy its
| hard to fill orders as quick as people want them. Ever wonder why you
| sometimes have to wait to get amp from Dmade.
|
|
|
| >
| > Now this Exportradios.com appears on the newsgroup.  BADDABING!  Exports
R
| > Us gets flamed.  Any connection there?
| ===========================================================
| I don't know what the connection is with exportradios  but maybe you can
| play mr detective for us before you accuse dmade or anyone of doing this,
we
| all know that its bullshit and steve would never do his customers any
wrong
| he is a saint.
|

Agreed; the FCC was quite active in the '70's noting that I received notice
that my aerial was 10 feet over the height limit. One recollection was sometime
around 1980 when the FCC issued nearly 30 violations in a two week period in my
community of 5000. It was plainly clear the FCC was intent on enforcing Part
95, further evidence of warnings received for operating QRP on abandoned RC
freqs.. gasp, how times have changed.

True..  Then buy the Chrome cases from Debbie like I did.  They look real nice
and fit perfectly...

Thanks

MC Turner

I'll take the razor one. Does it supply it's own shaving cream when you key it up?

I think 137 has stumbled on the real deal ( no pun intended) with this post.   I find it real hard to believe that Steve would screw anybody.  I have ordered thousands of dollars worth of gear and sent Many, Many people to him.  I have never had a single problem. Time and time again he does what is right in a bad situation.  UPS lost an item once.  Steve shipped a new unit out the next day. Guys, Don't believe this crap you hear.  Call the man on the phone and talk with him and you will see that the man has a good business sense..  He gets my business and I admit I am hard to please..

Not all audio amps are regulated like you think..  I used to volt a red Orion
amp at 18 volts..  with a 1 ohm load.. Actually allot of the real IASCA
competitors have damn good charging systems..   Plus IASCA installs are top
class as far as appearance goes..  That Blazer ran 4 Punch 1000's just for the
bass.  Plus Many other items and amps.. Also consider that they have to runt
hat stuff for an hour or more not 10 seconds.  That's why you generally see
more reserve power in a high watt audio system...

It was going on a month that I was waiting for my amp to come in. I was
getting worried that I had lost my money dealing with this company..
But, the amp came in and it was in perfect condition.. What had happened

is that the package got stuck at a major UPS bulk terminal.. It had nothing to do with Exports R Us, they had shipped as agreed..

We understand that. That's why I stated that " 1400 peak watts with a 200 watt carrier is over modulation.." Or reduced carrier AM....

I guess I did not make my self clear and I apologize.  I was just trying to state that if you stand still on an RMS meter you are still producing 1400+ watts of

peak
power if you are using a bird meter.

True..  I did state "bird 43".  I was using the Bird figure of 2.828 times RMS to
get peak just to prove a point.  The original post said 500 RMS watts.  Prozac
said 0% mod if he was holding steady at 500.  I was just letting him know that
this was not the case..

>
>
> Negative swing happens when your amp does not have enough reserve to

Or reduce the carrier so there is room.  That way you still get the peak out..

> Usually the point where the meter back swings to,
> is where you should then set the dead key power for, if you want to
> avoid further backswinging.
>

Good point... Or use a peak meter and tune for the general "rule" of 1/4 or peak..

Not the full potential of the system but still you are right. Dropping back on and RMS meter does not mean that you are going to sound bad or pinched in this particular setup.  Look on the scope or try a peak kit in the bird.  He still has 1400+ peak watts with that 800 watt carrier..

That's simply not true..  Are you saying that you would rather run that 16 watt radio
at the higher carrier than I stated?

JJ is missing the point.  Somebody once told him that swing kits are no good for
any purpose.  So he believed it. He probably has no electrical or RF theory to
back it up....  JJ lets hear your explanation of why Reduced Carrier AM
operation is not beneficial in any situation.  Also explain to us exactly why
you think it makes no difference on the receiver of the other station....

MC Turner

X-Admin: news@aol.com

Hey all.
Does anybody have the schematic for the Corbra 250 XL?
SWR at full power is 1.5:1.  But as I switch the power down (4 selections), SWR
goes up and up and up.
High - 1.5:1
Med/High  2.0:1
Med/Low  3.0:1
Low 5:1
Off   1.1:1

It's Very confusing, I don't really want to run an amp at all, DX conditions right now seem to require a bit--so I was hoping for a way to modulate the power back from full--but this box seems to be holding the power down by reflecting it back to the finals.
So, I'm looking for schematics, owners/operators manual and such.

Thanks all.

Please post all replies to the newsgroup--the email address is bogus.

I have over 40 years experience in electronics and radio communications, it has been explained many times, cbers refuse to believe it. Go back and read Dave's posts, he explains it well, if you can't understand that then you can't be helped.

>
> As to the original question, "are swing kits beneficial?" The answer depends on your objectives. If your goal is to be loud, obnoxious, and cause interference to both neighbors and other Cbers, then the swing kit will help. If you goal is just to put out a good, reasonably loud, but CLEAN signal, then a swing kit will not do you any good. Trying to run one with the mod limiter still functioning defeats the purpose. You cannot take advantage of the huge positive peak without having to deal with the drawbacks of the negative cutoff.
>
> There is a more complicated method called "controlled carrier" which allows the carrier ro rise in proportion to the modulation. Since the peak modulation is never more than 4 times the carrier(at its highest point), the negative cutoff can be kept right at 100%. But the apparent swing is still the same.
>
> Dave
> "Sandbagger"

Uh-oh Dave, you are challenging the "swing kit" myth here, Hank and others who like to believe in these myths won't like that.

Gee, Must of hit "mail to:" instead of "respond". Hope my mistake didn't run your day.

I don't see this as a ham vs. cb question. Nothing was ever said about operating in the ham bands. Guess legal vs. illegal operation is going to always be a ham vs. cb thing? Sorry, but I know a lot of cb'ers who operate legal - and a lot of hams that operate illegal. It depends on the person, not the license they hold.

Guess my point would have to be this. Maybe the radio will transmit up to 32 Mhz. Unlike 27.405 to 28.000 Mhz, between 29.7 and 32 Mhz there are various legal services operating, including business, the federal government, and state conservation officers - as in "law enforcement".

While operating on a business channel probably wouldn't cause you a whole lot of grief, sitting down on a state conservation channel would most likely bring you more hate and discontent than you can imagine. Seems like most cops have little sense of humor! And you definitely don't want to deal with operating on federal government radio frequencies.

BTW, I wasn't trying to upset anyone. Just trying to honestly answer a question. Sorry if that offended you.

Jim

Or if you are using the kit to tune the radio to an amp.  Allot of radio/amp setup would benefit from a  swing kit so there output is is More towards the linear side but with good peak power..  That's the main purpose of the kits in my opinion..

> If you goal is just to put out a good, reasonably loud, but
> CLEAN signal, then a swing kit will not do you any good.

Unless you are dealing with an amp that likes a low deadly but will benefit from good peak input power..

> Trying to run
> one with the mod limiter still functioning defeats the purpose.

Maybe, maybe not.  You can run a limiter with my kit. Just adjust the AMC correctly.  Some radios really do not want to produce much peak from a low carrier.

Plain and simple: RMS orPEAK

The only inteligent part of an AM signal is the modulation not the carrier.
right?

Now if you can swing your radio to swing from 90 to 100 watts you only have
10 watts of inteligent signal. Right?

No is you reduce this waisted carrier you say 5 watts and with a "swing kit"
still swing to 100 watts you now have 95 watts of inteligent signal. Right?

95 watts of inteligent signal is better then 5 watts of inteligent signal.
Right?

On most radios with out a "swing kit your modulation will clip off at such a
low carrier.

| > "clean".
|
| True..  I did state "bird 43".  I was using the Bird figure of 2.828 times
RMS to
| get peak just to prove a point.  The original post said 500 RMS watts.
Prozac
| said 0% mod if he was holding steady at 500.  I was just letting him know
that
| this was not the case..
|
| >
| >
| > Negative swing happens when your amp does not have enough reserve to

|
| We understand that. That's why I stated that " 1400 peak watts with a 200
watt
| carrier is over modulation.." Or reduced carrier AM....
|
| I guess I did not make my self clear and I apologize.  I was just trying
to state
| that if you stand still on an RMS meter you are still producing 1400+
watts of peak
| power if you are using a bird meter.
|

This means if you key 500 Peak And swing to 500 Peak you have no modulation
on AM mode.

I guess that like saying from (point A to point B) or (point A to point C)
are both 5. If not specified it would mean they are both the same distance.
unless I said one is 5 Ft and the other is 5 inches.

-
Your statements prove you understand nothing about it. Reducing the
carrier to 5 watts and swinging to 100 gains you nothing more that
having a 100 watt carrier fully modulated. You obviously understand
nothing about how modulating a carrier works.

Get it straigt, you say when you talk wattage you only talk peak or RMS
then you say not both. Then you say if not specified it means either RMS

or peak. So which is it? Maybe you need to take a little more of that prozac.

Take your bullshit scare tactic lies somewhere else.  You don't scare anyone here.      Lost licenses?   Confiscated Gear? OH REALLY?     Please state the call letters and names of the hams you are talking about! AND the source of your information.

FACT:   The FCC downsizing in 1996 resulted in the permanent closing of ALL monitoring stations.  Mobile monitoring operations ceased four years before that.   Since 1992, the FCC budget has been slashed to a quarter of what it was.   Manpower is a third of what it was. They can't control ham radio , where they use call signs,  and you think they can enforce CB?   YEAH Right!     The one guy doing ham enforcement, Riley Hollingsworth,  admitted on the air that he is doing it from his home. He copies down the CALL SIGN of the station breaking a rule(s), then writes them a warning letter.   He has done NOTHING about the hundreds of unidentified jammers on the ham bands, because he can't.  He has no way of locating or identifying them. H AH AH HA HA HA HA  CB enforcement, RIGHT!     More CB linears change hands in one weekend in Chicago than the FCC could ever dream of confiscating.

If you the output is a steady 500 watts, than yes, you have no
modulation, but if you apply audio and the carrier swings, it is
modulated. What you say above dosen't even make sense.

You need call signs,huh? Here's a couple of FCC busts taken from the January 2000 copy of Popular Communications:

1. KB9DUH (Brad Vincent)
2. KA9ZWH (Ernest Fulp)

'Nuff said...

They got what they deserved, it is pretty stupid to go to the effort to obtain a ham license and then operate illegally when you have all the ham bands where you can operate and be legal. As Forrest Gump would say, "stupid is as stupid does."

Thank you for you understanding. And for the other message, I hear some
great stories about Dave. Although I wouldn't mind meeting him I am not
losing sleep over the fact that I never will. I have some pretty nice stuff
he designed and that Is something I'm proud of. I heard people saying they
no longer like Dave or his products because he doesn't let people come to
the shop or what ever any more? That is a joke. Give the guy a break. Half
the people that brag about going to shops and seeing the box on a scope and
stuff like that don't even know what they are looking at. Know what I'm
saying?

Miles,

The Grant XL is within the list of radios that carry with it a "swing kit" exception.... I would not recommend anything more than buffering its limiting transistor and a good peaking..... Grant XL's are GREAT radios alone..... I have one, I love it.... If though, it is a good idea to make reference to CB brand name and models... Then, one radio that utilizes the "swing kit" wonderfully is the Cobra 25/29 LTD....

To answer your question with more detail.... I myself and not referring to pre-fabricated/mass produced "swing kits" as most of them do NOTHING. If you have that Papa/Mama Modulator with you, carefully take a hammer and bust it up.... I believe I read it is only a RESISTOR in the whole epocy shell..... wires such as the positive, negative and mic input aren't even used...... Pretty funny I think..

Miles Davis wrote in message <83nn8s$oo3$1@nnrp03.primenet.com>...
|Hey Hank Aaron,
|
|About 8 years ago I put a swing kit in a radio and it seemed to work with
an
|amp quite well. Almost 3 years ago I got one from Copper Electronics in TN.
|I followed the instructions on the install and turned on my radio and it
|started to smoke. As I was removing the device I checked with the
|instructions to see if I put it in right. I did. The radio is a GrantXL (my
|personal favorite!). At this time I'm batting about .500. Most of my Grants
|are tuned -out to maximum peak wattage and turned to about 2 watts or less.
|
|Question: What does a swing kit do that my method does not?
|
|--
|This is CB radio...........No crying allowed!
|

MC Turner you win my friend....

  I was not defending whether or not a "swing" kit in itself is
beneficial.... "Swing Kits" are most certainly beneficial period.

|
|Or if you are using the kit to tune the radio to an amp.  Allot of

```
radio/amp
|setup would benefit from a  swing kit so there output is is More towards
the
|linear side but with good peak power..  That's the main purpose of the kits
in my
|opinion..
|
|> If you goal is just to put out a good, reasonably loud, but
|> CLEAN signal, then a swing kit will not do you any good.
|
|Unless you are dealing with an amp that likes a low deadly but will benefit
from
|good peak input power..
|
|> Trying to run
|> one with the mod limiter still functioning defeats the purpose.
|
|Maybe, maybe not.  You can run a limiter with my kit. Just adjust the AMC
|correctly.  Some radios really do not want to produce much peak from a low
|carrier.
|
|> You
|> cannot take advantage of the huge positive peak without having to deal

Which is the whole point of the discussion!
You have a call sign and your name and
address are in the FCC's data base.
No call sign, no problem.  They don't
know who you are or where you are
and they have no way of finding you,
unless they want to spend a whole bunch
of money.    The FCC busts a couple
of CBers, then make a BIG publicity
splash hoping it scares everyone.  The
truth is they do not have the money or
manpower or equipment to go after
millions of CBers.   they're having enough
trouble trying to close down a few dozen
low-power FM (unlicensed) stations
around the country.    they caught some
nut in Atlanta jamming commercial aircraft.
It cost them so much money that they had
to ask for a special congressional
supplement to their budget this year.

about
|> this.... though I HAVE provided THE explanation as to WHY "swing kits"
are
|> beneficial, and in fact -DO- something.  Your turn...
|
|
|Ok, here's the REAL deal. Swing kits are more "form" than "function".
|Yes, they can allow higher positive modulation, simply because they are
|lowering the carrier. The peak power is the same as it was before.
|
|The downside is that you can NEVER exceed 100% negative modulation. At
|100% negative, you are at ZERO power. Increasing modulation only widens
|the cutoff point. Modulation that is driven to cutoff will cause
|distortion and splatter. That guy that bleeds you all 40 channels, is
|probably running a badly butchered radio with a "swing kit".
|
```

|
|As to the original question, "are swing kits beneficial?" The answer
|depends on your objectives. If your goal is to be loud, obnoxious, and
|cause interference to both neighbors and other Cbers, then the swing kit
|will help. If you goal is just to put out a good, reasonably loud, but
|CLEAN signal, then a swing kit will not do you any good. Trying to run
|one with the mod limiter still functioning defeats the purpose. You
|cannot take advantage of the huge positive peak without having to deal
|with the drawbacks of the negative cutoff.
|
|There is a more complicated method called "controlled carrier" which
|allows the carrier ro rise in proportion to the modulation. Since the
|peak modulation is never more than 4 times the carrier(at its highest
|point), the negative cutoff can be kept right at 100%. But the apparent
|swing is still the same.
|
|
|Dave
|"Sandbagger"
|
|

Dave,

Usually in a "swing kit" the collector of the final receives a burst of positive voltage, which is in phase with the positive modulation swing. This added DC voltage causes the final to amplify to a greater extent and increase transmitter output power in step with the positive peak modulation.

As far as interference, etc, etc.... I suppose if someone disables their limiter then, they might as well make use of the swing kit.... which is beneficial..... does it give the appearance that they are louder? I say yes.... if yes is the answer, then its safe to say it has a benefit.... this debate/argument is NOT over the fact of how good the benefit is or is not

Take care
Hank

Reason is that some people like "pingers".... and if something is set to

constant receive as is the case most of the time..... hmmm.... you have a
good idea.... but now that -I- thought about it... I think in my situation
it would be best to keep to what I do already... since a lot of
radios/chassis are different, I believe it would entail more "thinking" than
the process I perform already.  Know what Im saying?  Let me know if that
came out right...

Unable carry on honest discussion, eh?  I have been in CB and HAM for
more than 30 years.  Seen a lot.  IMHO, you are the one biased against
hams.  As far as me being narrow minded, try reading the CFR and putting
it into the reality of the world.
Happy Holidays de Martin N5PZJ

I just tried it with a dummy load and the SWR was perfect 1.0:1.0 accrose all
power settings.

Strange.  Is the dialectric in the cable (rg58) breaking down as I increase the
power?  What's going on here?

again, please reply by posting, the email address is bogus.
